

**Summary of Available Data for LOUs 34E, 47, 48, 49, 50, 51 and Area 70
Multiple LOUs Located in Operational Manganese Leach Plant Area
Tronox Facility – Henderson, Nevada**

Name of LOU:	Multiple LOUs associated with the Manganese Leach Plant plus the U.S. Vanadium Leasehold LOU 34E – Former Manganese Tailings Area, East LOU 47 – Current and Historical Leach Plant Area Manganese Ore Piles LOU 48 – Leach Plant Anolyte Tanks LOU 49 – Leach Plant Area Sulfuric Acid Storage Tanks LOU 50 – Current and Historical Leach Plant Area Leach Tanks LOU 51 – Leach Plant Transfer Lines Area 70 – U.S. Vanadium Leasehold
Goal of Closure:	<ul style="list-style-type: none">Closure not requested at this time. Current operations to continue.
Site Investigation Area:	<ul style="list-style-type: none">Six LOUs and Area 70 are combined within the Manganese (Mn) Leach Plant area.Most facilities (tanks, tailings/or piles, piping) have been moved several times within the Leach Plant area since operations commenced.The Leach Plant is located north of Units 5 and 6 in an area approximately 750 feet by 500 feet (8.6 acres).

LOU 34E – Former Manganese Tailings Area, East

- Size: Approximately 170 feet by 110 feet (0.4 acre)
- Location: Southeast portion of the Site, approximately 175 feet north of Unit 6.
- Current Status/Features: LOU 34E is no longer active. Tailings were removed and placed in LOU 24 (Historic Mn Tailings Pile). This area currently contains the anolyte storage tanks associated with the Leach Plant.

LOU 47 – Current and Historical Leach Plant Area

Manganese Ore Piles

Historical Leach Plant Area Mn Ore Piles

- Size: The southern portion is approximately 340 feet by 200 feet (1.6 acres) and the northern portion is approximately 75 feet by 290 feet (0.5 acre).
- Location: Within the eastern half of the Manganese Leach Plant Area, north of Units 5 and 6.
- Current Status/Features: The historical Mn Ore Pile location is no longer used. The southern portion of this area currently contains a portion of the active Mn Leach Plant equipment. The southeast portion of this area is currently occupied by anolyte storage tanks.

**Summary of Available Data for LOUs 34E, 47, 48, 49, 50, 51 and Area 70
Multiple LOUs Located in Operational Manganese Leach Plant Area**
Tronox Facility – Henderson, Nevada

Current Leach Plant Area Mn Ore Piles

- Size: This area is approximately 260 feet by 210 feet (1.3 acres).
- Location: Within the northeastern half of the Manganese Leach Plant Area, north of Units 5 and 6.
- Current Status/Features: This LOU is currently used for storage of the active manganese ore pile.

LOU 48 – Leach Plant Anolyte Tanks

Historical Leach Plant Anolyte Tanks

- Size: Approximately 70 feet by 60 feet (0.1 acre).
- Location: Western portion of the Manganese Leach Plant Area, north of Unit 5.
- Current Status/Features: One of the historic anolyte tanks is still present in the area southeast of LOU 50 (Leach Plant Area Tanks).

Current Leach Plant Anolyte Tanks

- Size: Approximately 140 feet by 110 feet (0.3 acre).
- Location: Southeast corner of the Manganese Leach Plant Area, north of Unit 6.
- Current Status/Features: Three anolyte storage tanks currently located in the southeast corner of the Leach Plant area. The three tanks are housed within secondary containment.

LOU 49 – Leach Plant Area Sulfuric Acid Storage Tanks

- Size: Approximately 20 feet by 30 feet.
- Location: Northwest portion of Leach Plant, approximately 550 feet north of Unit 5.
- Current Status/Features: LOU 49 is currently active and contains a vertical, closed top aboveground storage tank (AST) installed on a concrete containment pad.

LOU 50 – Leach Plant Area Leach Tanks

- Size: Approximately 90 feet by 70 feet (0.1 acre).
- Location: Northwest portion of the Manganese Leach Plant Area, north of Unit 5.
- Current Status/Features: The leach tanks are currently in use.

LOU 51 – Leach Plant Transfer Lines

- Size: Approximately 900 linear feet.
- Location: The transfer lines originate in the Leach Plant and anolyte tank and extend into in Unit 6.
- Current Status/Features: The transfer lines are currently in use.

**Summary of Available Data for LOUs 34E, 47, 48, 49, 50, 51 and Area 70
Multiple LOUs Located in Operational Manganese Leach Plant Area**
Tronox Facility – Henderson, Nevada

Area 70 – U.S. Vanadium Leasehold

- Size: Approximately 400 feet by 450 feet (4.1 acres).
- Location: North of Unit 6 in the southeast portion of the Leach Plant.
- Current Status/Features: Currently part of the active Manganese Leach Plant facility [Ref. 6].

Description:

Mn Leach Plant

The Mn Leach Plant itself is not an LOU; however, parts of the plant have been identified as LOUs (LOUs 34E, 47, 48, 49, 50, and 51). The following description of the Leach Plant has been included to provide a broader understanding of the processes associated with the LOUs in the Leach Plant.

- The Leach Plant houses all facilities associated with the beneficiation of manganese dioxide ore to produce cell feed sent to Units 5 and 6 [Ref. 5].
- The plant has been operational since 1951 and is planned to be active for the foreseeable future [Ref. 4].
- The plant houses a variety of tanks including manganese sulfate anolyte tanks, sulfuric acid storage tanks, leach tanks, process equipment, overhead and underground transfer lines, manganese tailing piles, and ore piles.
- Most facilities (tanks, lines, tailing piles, and ore piles) have been moved within the Leach Plant facility (i.e., anolyte tanks were in southeast corner and are now in the northwest corner of Leach Plant).
- Materials used at the site include manganese dioxide ore (50% Mn by weight), historically coal and coke (not used in current process), natural gas, sulfuric acid, barium sulfide, diatomaceous earth, lime (dolomite), hydrogen sulfide, and flocculent.
- The manganese purification process begins with the roasting of manganese ore (Mn ore) to convert it to soluble manganese oxide [Ref. 5].
- The manganese is then leached out with acid and the residual material is the manganese tailings [Ref. 5].
- The solution containing the dissolved manganese is then purified by precipitation with sulfides and the high concentration manganese liquor from this process becomes the cell feed that is piped to Units 5 and 6 for plating of manganese dioxide onto electrodes [Ref. 5].
- Process wastes from calcining, leach tanks, cathode wash, etc., were historically piped to surface ponds C-1 (LOU 20) and Mn-1 (LOU 21).

**Summary of Available Data for LOUs 34E, 47, 48, 49, 50, 51 and Area 70
Multiple LOUs Located in Operational Manganese Leach Plant Area**
Tronox Facility – Henderson, Nevada

- The purified manganese dioxide is then removed from the electrodes, washed (in Unit 6), ground to a uniform size and placed in super sacks for sale [Ref. 5].

**LOU 47 – Current and Historical Leach Plant Area
Manganese Ore Piles**

- Mn ore piles in LOU 47 were/are typically stored in windrow-type piles 10 to 15 feet high and more than 300 feet long [Ref. 3].
- Surface piles are not contained [Ref. 3].
- Mn ore has been stored and processed onsite since WECCO initiated electrolytic manganese dioxide production in 1951 [Ref. 3].
- Mn ore consists of gravel-size (1/2- to 1-inch diameter) particles to reduce potential for wind-blown releases of fine particulates [Ref. 3].
- Historically, the source of Mn ore has been from one location: a mine in Gabon, West Africa [Ref. 4].

LOU 48 – Leach Plant Anolyte Tanks

- LOU 48 has three ASTs housed within a concrete containment berm. the ASTs are used to hold manganese sulfate anolyte solution (a sulfuric acid and manganese sulfate solution) [Ref. 4].
- The ASTs are constructed of rubber-lined or fiberglass-lined carbon steel and are used to store anolyte [Ref. 3].
- Two historical anolyte storage tanks are believed to have been installed by WECCO between 1950 and 1953 without containment at the southeast corner of LOU 50 (Figure 1) [Ref. 4].
- The current anolyte tanks along with the secondary containment system were installed in 1992 [Ref. 3].
- The current tank area was previously used for Mn ore piles [Ref. 4].

LOU 49 – Leach Plant Area Sulfuric Acid Storage Tanks

- LOU 49 consists of an AST housed on a containment pad used to store sulfuric acid until needed by the process [Ref. 4].

**LOU 50 – Current and Historical Leach Plant Area Leach
Tanks**

- The leach tanks in LOU 50 are housed on containment pads and are used to leach the manganese dioxide ore to gain its manganese value for use in the Unit 6 electrolyte cells. The Leach Plant contains two sets of leach tanks (all open top tanks installed within a concrete containment area):

Summary of Available Data for LOUs 34E, 47, 48, 49, 50, 51 and Area 70 Multiple LOUs Located in Operational Manganese Leach Plant Area

Tronox Facility – Henderson, Nevada

- The first set of Leach Tanks includes four ASTs (each 2,000- to 3,000-gallon capacity) installed circa 1950 to 1953 taken out of service on August 1, 1991 [Ref. 3].
- The second set of Leach Tanks was brought on-line on August 1, 1991 and is located within secondary containment with a total capacity rated at 250,000-gallons [Ref. 3].
- Locations of both sets of tanks are shown on Figure 1.
- The Leach Plant also includes open roasting hearths (permitted) to reduce the manganese dioxide to manganese oxide which is fed to the leach tanks (LOU 50). Drop-down hoods cover the ore piles during the roasting process [Ref. 5].
- Manganese oxide is leached from calcined ore using fresh sulfuric acid and anolyte solution in these tanks [Ref. 3].

LOU 51 – Leach Plant Transfer Lines

- The transfer lines in LOU 51 cross the Leach Plant area to and from Unit 6. There are also two adjacent aboveground pipelines (including pipe rack, pipe trench, and pipe supports) where solutions are transferred between the Leach Plant and Unit 6 [Ref 3]:
 - One pipeline carries concentrated manganese sulfate solution from the Leach Plant to the Unit 6 electrolytic cells, where manganese dioxide is plated out [Ref. 3].
 - The second pipeline carries the spent anolyte solution (sulfuric acid and any remaining manganese sulfate) from Unit 6 back to the Leach Plant for reconstitution [Ref. 3].
 - Within the Leach Plant, the pipelines form a network of conveyances enabling the transfer of anolyte, sulfuric acid, manganese sulfate, and other solutions throughout the Leach Plant as shown on Figure 1 [Ref. 3].
- The original Leach Plant had underground transfer lines made with high-density polybutylene (HDPB) and high density polyethylene (HDPE) [Ref. 3].
- In 1986, the underground pipelines were replaced with aboveground pipelines (Teflon-lined carbon steel) [Ref. 3].

Area 70 – U.S. Vanadium Leasehold

- With the exception of the boundary of the area leased to U.S. Vanadium, little information is known about the operations carried out by U.S. Vanadium. The plant reportedly made tungsten products.

**Summary of Available Data for LOUs 34E, 47, 48, 49, 50, 51 and Area 70

Overlapping or Adjacent LOUs: The following LOUs overlap or are adjacent:

Overlapping:

- LOUs 34E, 47, 48, 51, and Area 70 overlap each other.
- LOU 59 (Storm Sewer System) – Overlaps LOU 47 and Area 70.
- LOU 60 (Acid Drain System) – Overlaps the northern (downgradient) portion of the historical portion of LOU 47 and the southern portion of LOU 50.

Adjacent LOUs

- LOU 48 (Leach Plant Anolyte Tanks) – Historical tanks are located east of LOU 50. LOU 48 is also bound on the west, north, and east side by LOU 51 (Leach Plant Transfer Lines).
- LOU 49 (Leach Plant Area Sulfuric Acid Storage Tank) – Located east (cross-gradient) of the northern portion of LOU 50 (Current and Historical Leach Plant Area Leach Tanks).
- LOU 59 (Storm Sewer System) – Located south (downgradient) of LOUs 47, 34E, and 50.
 - LOU 59 located west (cross-gradient) of LOU 34E and LOU 48.
 - LOU 59 located east (cross-gradient) of LOUs 34E, 47, 48, 51, and Area 70.
- LOU 60 (Acid Drain System) – Located east (cross-gradient) of LOUs 34E, 47, 48, 51, and Area 70.

**Summary of Available Data for LOUs 34E, 47, 48, 49, 50, 51 and Area 70
Multiple LOUs Located in Operational Manganese Leach Plant Area
Tronox Facility – Henderson, Nevada**

- LOUs Potentially Affecting Soils in LOUs:**
- The overlapping LOUs in this area associated with the historical and current Leach Plant operations have the potential for affecting each other.
 - Known or potential chemical classes associated with adjacent or overlapping LOUs are consistent with each other; therefore, no additional chemical classes have been added to the Phase B Analytical Plan for LOUs 34E, 47, 48, 49, 50, 51, and Area 70. For detailed information on these LOUs, please refer to the specific LOU data package.
- Known or Potential Chemical Classes:**
- Metals
 - Tungsten (associated with Area 70)
 - Wet chemistry analytes
- Known or Potential Release Mechanisms:**
- LOU 34E – Former Manganese Tailings Area and East LOU 47 – Current and Historical Leach Plant Area Mn Ore Piles**
- Potential storm water run off from the historic manganese tailings or historic/current ore piles.
 - Potential infiltration to subsurface soils and groundwater.
- LOU 48 – Leach Plant Anolyte Tanks and LOU 49 – Leach Plant Area Sulfuric Acid Storage Tanks**
- No known releases were identified in the documents reviewed.
 - Possible overflow, spills, and/or releases (if any) from tanks and containments to the soil and groundwater (none documented).
 - Potential leaks from process piping to the soil and groundwater.
 - Possible releases from the waste piping (to and from ponds C-1, Mn-1, WC-West and WC-East) to the soil and groundwater.
 - Possible surface flow of releases (if any) north to the Beta Ditch.
- LOU 50 – Current and Historical Leach Plant Area Leach Tanks**
- Documented releases include the following:
 - The concrete containment area and surrounding soil within a 5-foot radius of each of the four original tanks were stained from historic spills [Ref. 3].

**Summary of Available Data for LOUs 34E, 47, 48, 49, 50, 51 and Area 70
Multiple LOUs Located in Operational Manganese Leach Plant Area**
Tronox Facility – Henderson, Nevada

LOU 51 – Leach Plant Transfer Lines

- Documented releases include the following [Ref. 3]:
 - On February 25, 1986 approximately 5,500-gallons of anolyte solution containing 139 gallons (2,130 pounds) of sulfuric acid were released to the ground surface when an anolyte transfer line separated.
 - A buried anolyte transfer line has been the source of numerous small leaks.
- Documented response actions for the releases included the following measures [Ref. 3]:
 - Stopping liquid flow in leaking line by activating proper process controls;
 - Using manganese tailings from the onsite manganese tailings area to contain, neutralize (tailings pH = 8-9), and absorb released liquid;
 - Neutralizing leaked solution with either lime or soda ash;
 - Testing remediated material for non-hazardous pH conditions and subsequently disposing material in onsite manganese tailings area; and
 - Notifying appropriate agencies of release and mitigation measures taken (reportable quantity for sulfuric acid release is 1,000 pounds).

Results of Historical Sampling:

- Mn tailings and Mn ore tested as non-hazardous on several occasions, including during the Phase A Source Area Investigation [Ref. 1].
- Upgradient and downgradient monitoring wells (M-11, M-31A, M-52, M-77, M-32, and M-33) are tested for chromium, hexavalent chromium, perchlorate, manganese, TDS, pH, and electrical conductivity as part of periodic or routine groundwater monitoring programs [Ref. 2].

Analytical results for soil and groundwater from historical sampling events are summarized in LOUs 34E, 47, 48, 49, 50, 51, and Area 70 Tables 22, 23, and 24 (see attached).

Did Historical Samples Address Potential Release?

- Partially. Historic Mn tailings and Mn ore samples confirm that these materials are non-hazardous; however, there are no historical soil samples in other areas of the Leach Plant; therefore, potential releases associated with the Leach Plant have not been addressed.

**Summary of Available Data for LOUs 34E, 47, 48, 49, 50, 51 and Area 70
Multiple LOUs Located in Operational Manganese Leach Plant Area**
Tronox Facility – Henderson, Nevada

Summary of Phase A SAI:

Soil

- Phase A boring SA13 is located in northern portion of the Leach Plant area and was specifically sampled to evaluate LOUs 48, 49, and 50.
- Phase A borings SA07 and SA08 located about 100 feet south of the LOUs in the Leach Plant area and were not specifically sampled to evaluate the LOUs in the Leach Plant area.

Groundwater

- The closest well sampled (M-31A) is located northeast (downgradient) of LOUs 48, 49, and 50 and was specifically sampled to evaluate these LOUs.
- The closest downgradient well sampled (M-11) is located south and southwest of the LOUs in the Leach Plant area and was not specifically sampled to evaluate these LOUs.
- The closest groundwater sample (GWSA08) was collected from Phase A boring SA08 located southeast of the Leach Plant area and was not specifically sampled to evaluate these LOUs.

Chemical classes detected in Phase A soil borings SA07, SA08, and SA13:

- Metals (Phase A list)
- Hexavalent chromium (SA07 and SA13)
- Perchlorate
- Wet chemistry analytes
- VOCs
- SVOCs (SA08)
- TPH-ORO (SA07)
- TPH-GRO/DRO (SA08)
- Organochlorine pesticides (SA13)
- Dioxins/furans (SA07 and SA08)
- Radionuclides
- Asbestos

As a result of the Phase A data, the Phase B analytical plan for samples collected from LOUs 34E, 47, 48, 49, 50, 51, and Area 70 will be expanded to include analyses for perchlorate, VOCs, SVOCs, TPH-GRO/DRO/ORO, organochlorine pesticides, dioxins/furans, radionuclides, and asbestos.

- Analytical results for soil and groundwater from the Phase A sampling event are summarized in LOU 34E, 47, 48, 49, 50, 51, and Area 70 Tables 1 through 21 (see attached).

**Summary of Available Data for LOUs 34E, 47, 48, 49, 50, 51 and Area 70
Multiple LOUs Located in Operational Manganese Leach Plant Area**

Tronox Facility – Henderson, Nevada

Are Phase A Sample Locations in “Worst Case” Areas?

- Only the Mn ore and Mn tailings samples are considered to be worst case samples for LOUs 34E and 47.
- Phase A sample locations are not considered to be worst case samples for the LOUs in the Leach Plant area.

Is Phase B Investigation Recommended?

- Yes, for selected locations that will not impact Leach Plant operations or breach secondary containment structures.

Proposed Phase B Soil Investigation/Rationale:

Focused investigation activities for the LOUs within the Leach Plant area will be deferred to the future, when the entire plant is permanently closed, for the following reasons:

- Drilling equipment cannot adequately access areas within or adjacent to these LOU due to the close proximity of nearby operating equipment.
- Numerous active overhead and underground pipelines (including high pressure natural gas lines and product transfer lines) crisscross the Leach Plant area, creating potential safety hazards to field personnel engaged in subsurface sampling activities.

The Phase B Source Area Investigation for these LOUs will consist of collecting soil samples from six (6) locations:

- Four (4) soil borings (SA37, SA38, RSAQ8, and RSAP8) will be drilled within the boundaries of LOU 34E, 47, and Area 70.
- One (1) soil boring (SA140) will be drilled north (downgradient) of LOUs 49 and 50.
- One (1) soil boring (RSAQ7) will be drilled south (upgradient) of LOUs 49 and 50.
- All six borings along with the analytical program to evaluate soil samples from LOUs 34E, 47, 48, 49, 50, 51, and Area 70 are listed on **Table A – Soil Sampling and Analytical Plan for LOUs 34E, 47, 48, 49, 50, 51, and Area 70**.
- Soil sample locations consist of both judgmental and randomly-placed locations.
- Judgmental sample locations:
 - Designed to evaluate soil for known or potential chemical classes associated with LOUs 34E, 47, 48, 49, 50, 51 and Area 70, based on the known process waste streams.
 - Three (3) of the six (6) borings are judgmental and include the following soil borings SA140, SA38, and SA37.

**Summary of Available Data for LOUs 34E, 47, 48, 49, 50, 51 and Area 70
Multiple LOUs Located in Operational Manganese Leach Plant Area**
Tronox Facility – Henderson, Nevada

- Random sample grid locations:
 - Designed to assess whether unknown constituents associated with the multiple LOUs are present.
 - Three (3) soil borings (RSAP8, RSAQ7, and RSAQ8) are randomly-placed sample locations.

Proposed Phase B Constituents List for Soils: Both judgmental and random sample locations will be analyzed for the following constituents:

- Metals (Phase A list)
- Hexavalent chromium
- Tungsten (SA38, SA37, and RSAQ8 only)
- Perchlorate
- Wet chemistry analytes
- VOCs
- SVOCs
- TPH-DRO/ORO
- TPH-GRO (SA38 and SA37 only)
- Organochlorine pesticides
- Dioxins/furans
- Radionuclides
- Asbestos

Proposed Phase B Groundwater Investigation/Rationale: Direct assessment to be delayed until the Leach Plant is removed from service in the future.

The Phase B groundwater investigation of LOUs 34E, 47, 48, 49, 50, 51 and Area 70 consists of collecting groundwater samples from six (6) locations to evaluate local groundwater conditions and as part of site-wide evaluation of constituent trends in groundwater.

- One (1) well (M-77) within the boundaries of LOU 47 and Area 70 will be sampled.
- Two (2) wells south (upgradient) of LOUs 34E, 47, 48, and Area 70 will be sampled. These wells are M-122 and M-11.
- Two (2) wells north (downgradient) of LOUs 34E, 47, 48, 49 and 50 will be sampled. These wells are M-141 and CLU1.
- One (1) well (M-52) west (cross-gradient) of LOUs 50 and 48 will be sampled.
- All six wells along with the analytical program to evaluate groundwater samples associated with LOUs 34E, 47, 48, 49, 50, 51 and Area 70 are listed on **Table B – Groundwater Sampling and Analytical Plan for LOUs 34E, 47, 48, 49, 50, 51 and Area 70**.

**Summary of Available Data for LOUs 34E, 47, 48, 49, 50, 51 and Area 70
Multiple LOUs Located in Operational Manganese Leach Plant Area
Tronox Facility – Henderson, Nevada**

Proposed Phase B Constituents List for Groundwater: Groundwater samples will be analyzed for the following analytes:

- Metals (Phase A list)
- Hexavalent chromium
- Perchlorate
- Wet chemistry analytes
- VOCs
- SVOCs
- Organochlorine pesticides
- Radionuclides

Proposed phase B Soil Gas Investigation/Rationale: • None proposed specifically for this LOU.

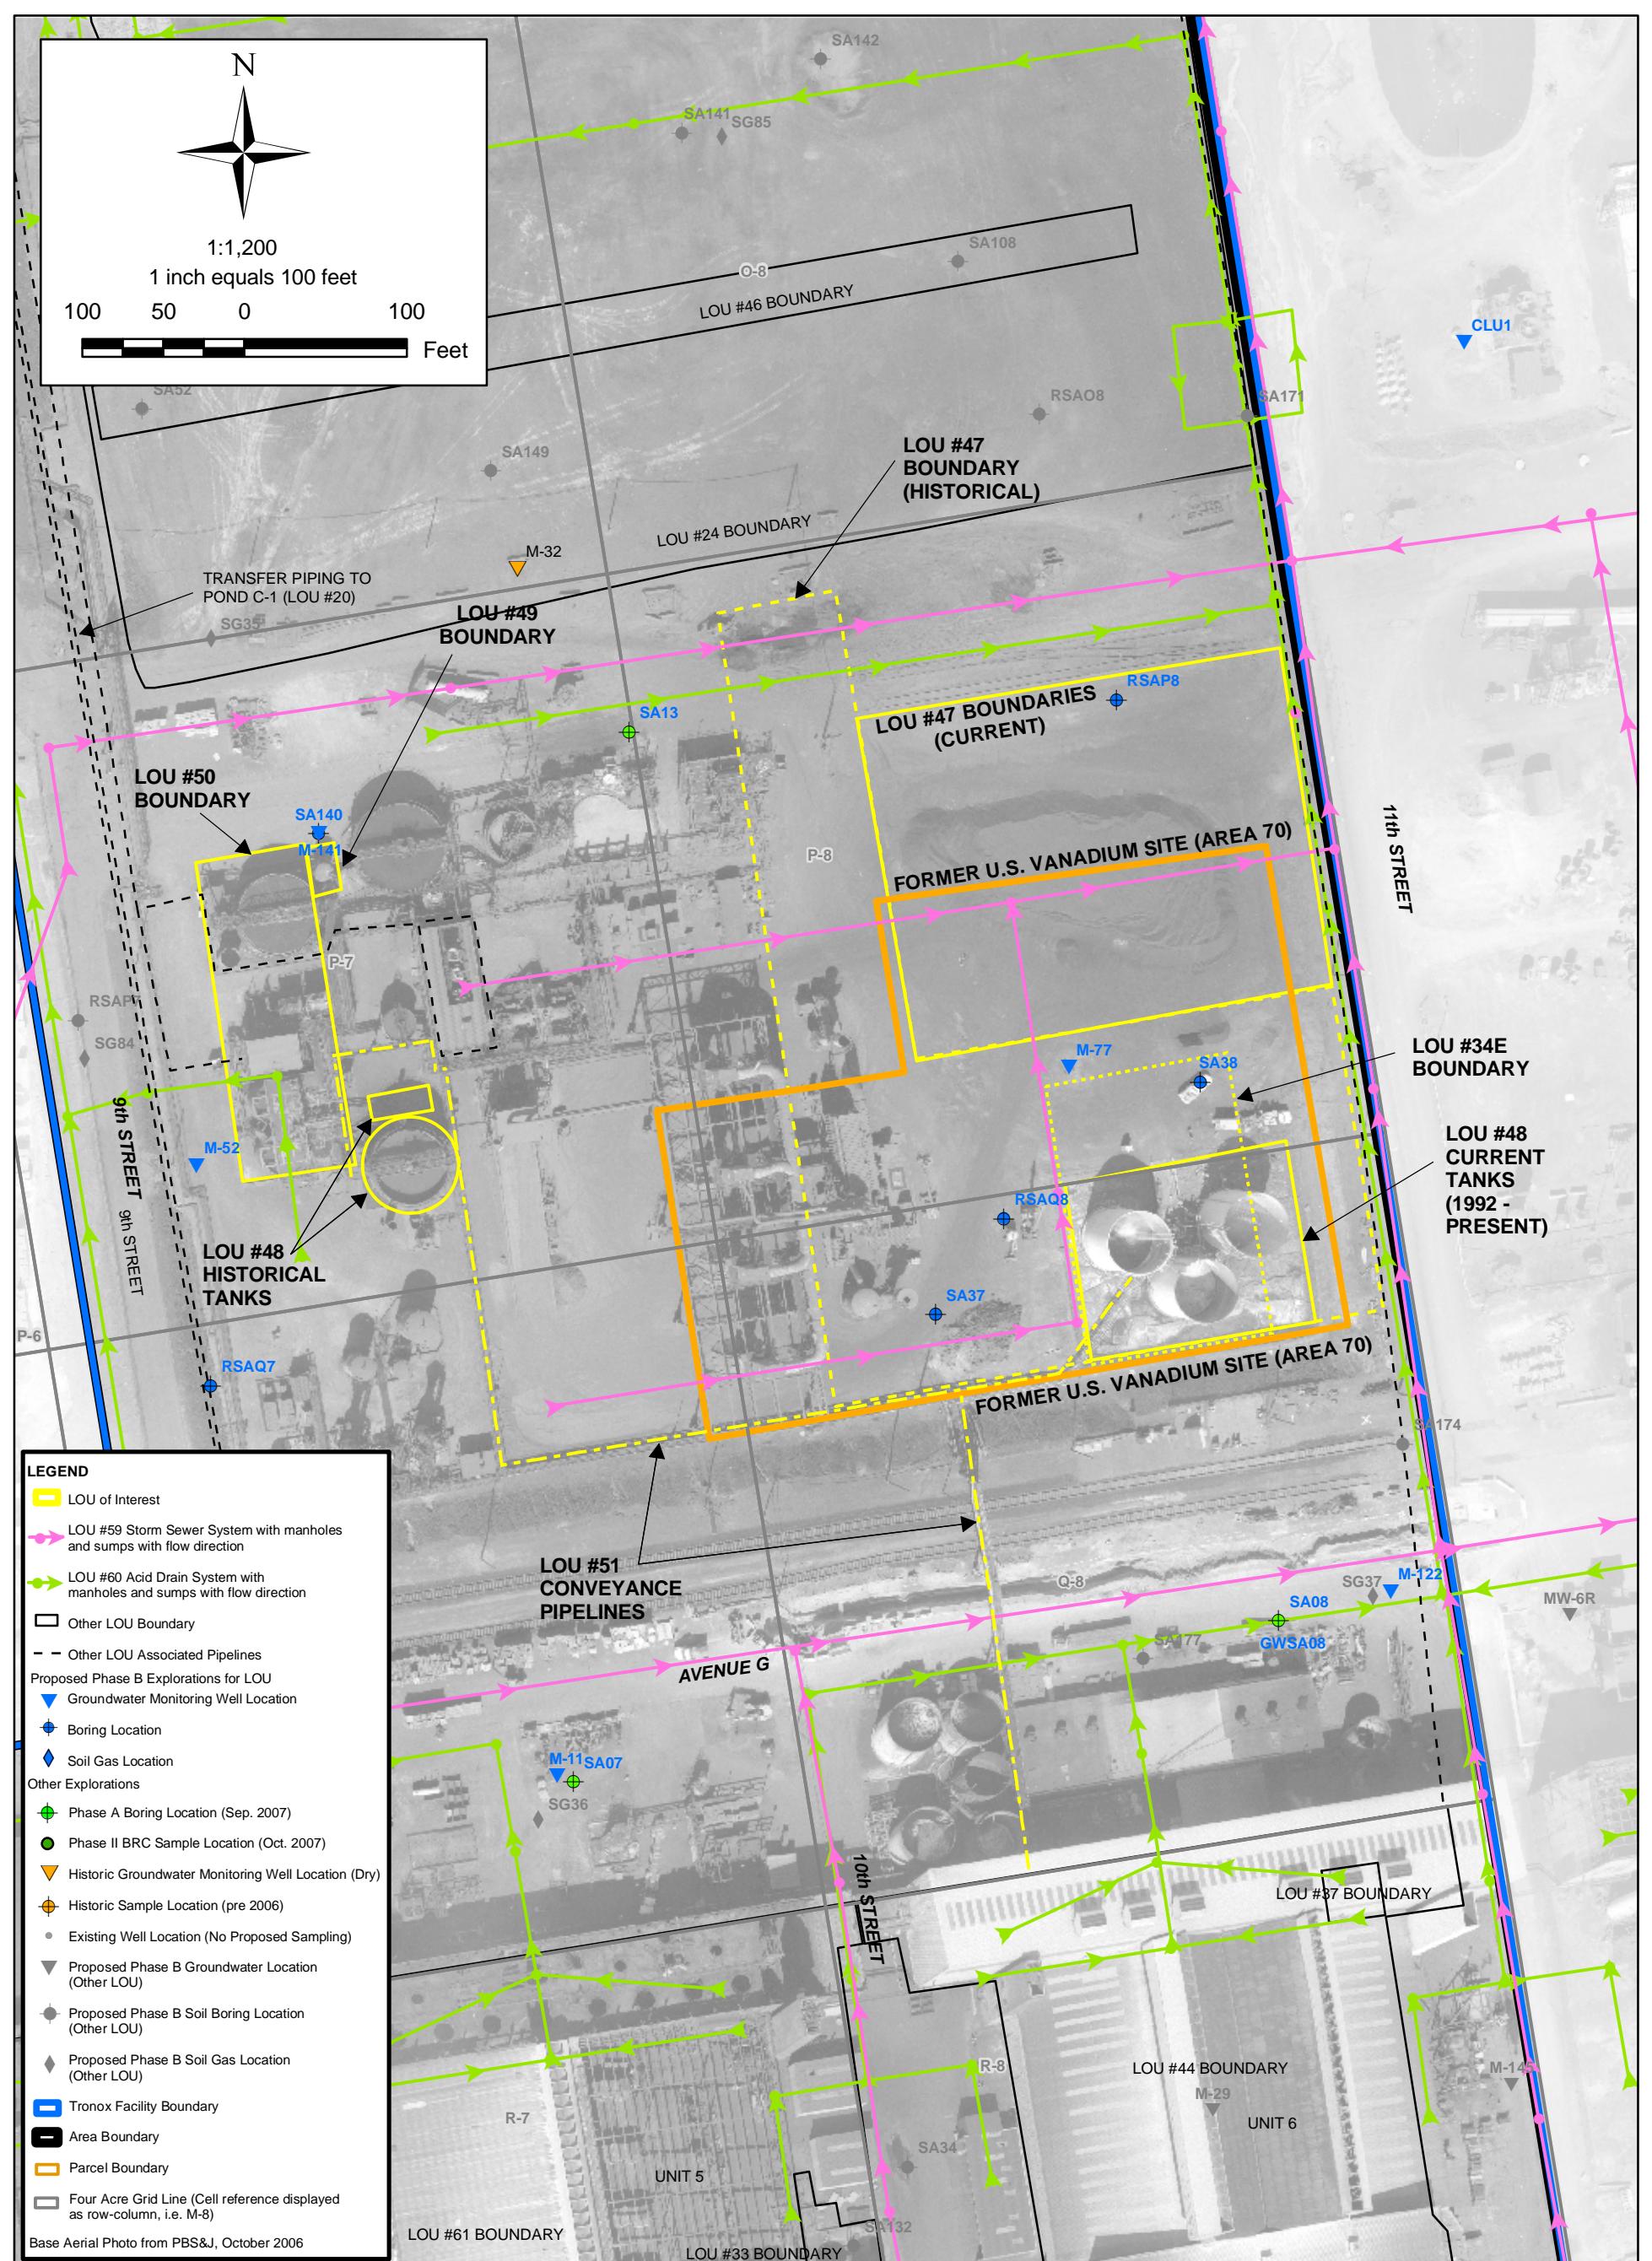

Proposed Phase B Constituents List for Soil Gas: • None proposed specifically for this LOU.

P-7	III	M-141	TBD	TBD	new well	X	X	X	X	X	X	X	X	New monitoring well co-located with boring SA140 to evaluate LOUs 49 and 50.
P-8	III	M-77	29 - 43.8	Qal/MCcfg1	no	X	X	X	X	X	X	X	X	Located to evaluate LOUs 34E, 47 through 51 and Area 70 (former U.S. Vanadium); as a downgradient step out for LOUs 33, 40, and 61; as a crossgradient step out for LOU 59; and for general Site coverage.
Q-7	III	M-11	33.3 - 53	Qal/MCcfg1	yes	X	X	X	X	X	X	X	X	Located as a downgradient step out for LOU 61; as an upgradient step out for LOUs 34E, 47 through 51 and Area 70 (former U.S. Vanadium); as a crossgradient step out for LOUs 20, 22, 23, and 60, and for general Site coverage.
Q-8	III	M-122	TBD	TBD	new well	X	X	X	X	X	X	X	X	New monitoring well located to serve as a downgradient step out for LOUs 37, 44, and 60; as an upgradient step out for LOUs 34E, 47, 48, 51, 59 and Area 70 (former U.S. Vanadium); to evaluate possible offsite sources to the east; and for general Site coverage.
Number of Field Samples:						6	6	6	6	6	6	6	6	
Notes:														
X	Sample will be collected and analyzed.													
1	It is anticipated that the large majority of the flow to the well will be from the coarse-grained sediments. As such, in the cases where there are two lithologies present across the screen interval, the water sampled will represent conditions in the coarse-grained interval.													
2	VOCs = Volatile organic compounds (to include analysis for naphthalene).													
3	OCPs = Organochlorine pesticides (to include analysis for hexachlorobenzene).													
4	SVOCs = Semi volatile organic compounds.													
5	Radionuclides consists of alpha spec reporting for isotopic Thorium and isotopic Uranium, and Radium-226, plus Radium-228 by beta counting (per NDEP).													
(a)	(a) Complete list of wet chemistry parameters are shown on Table 1. All groundwater samples will have pH measured in the field.													
IIIN/E/W/S	Well located outside (north, east, west, or south) of Area III.													
TBD	To be determined when well is constructed.													
nr	Not recorded in the All Wells Database (June 2008).													
Qal	Quaternary Alluvium													
MCfg1	Muddy Creek Formation - first fine-grained facies													
MCcg1	Muddy Creek Formation - first coarse-grained facies													
MCfg2	Muddy Creek Formation - second fine-grained facies													

**Summary of Available Data for LOUs 34E, 47, 48, 49, 50, 51 and Area 70
Multiple LOUs Located in Operational Manganese Leach Plant Area
Tronox Facility – Henderson, Nevada**

Soil and Groundwater Characterization Data

**Summary of Available Data for LOUs 34E, 47, 48, 49, 50, 51 and Area 70
Multiple LOUs Located in Operational Manganese Leach Plant Area
Tronox Facility – Henderson, Nevada**

LOU-specific analytes identified include:

- Wet chemistry analytes
- Dioxins/furans
- Metals
- Organochlorine pesticides
- Perchlorate
- Radionuclides
- SVOCs
- TPH
- VOCs
- Asbestos
- Tungsten
- Hexavalent chromium

The tables in **BOLD** below present historical data associated with these LOU specific analytes.

LOUs 34E, 47, 48, 49, 50, 51 and Area 70

Notes:

1. ENSR, 2007, Phase A Source Area Investigation Results, Tronox Facility, Henderson, Nevada, September 2007.
2. U.S. EPA, Region 6, Medium Specific Screening Levels (MSSLs) for Industrial - Outdoor Worker (March, 2008).
 - (a) Calculated assuming 0 for non-detected congeners and 2006 toxic equivalency factors (TEFs).
 - (b) Calculated assuming 1/2 detection limit as proxy for non-detected congeners and 2006 TEFs.
 - (h) Dioxins and furans were expressed as 2,3,7,8- TCDD TEQ (toxic equivalents), calculated using the TEFs published by Van den Berg et al., 2006.
- (v) USEPA. 1998. Approach for Addressing Dioxin in Soil at CERCLA and RCRA Sites. OSWER Directive 9200.4-26. April, 1998. A value of 1000 ng/kg is applicable to residential soils. The range of 5000 to 20000 ng/kg is applicable to commercial/industrial soils. The Agency for Toxic Substances and Disease Registry (ATSDR) provides a screening level of 50 ng/kg for dioxin in residential soil [<http://www.atsdr.cdc.gov/substances/dioxin/policy/>].

Notes:

1. ENSR, 2007, Phase A Source Area Investigation Results, Tronox Facility, Henderson, Nevada, September 2007.
2. U.S. EPA Maximum Contaminant Level (MCL) values unless noted
 - (j) Secondary Drinking Water Regulation value.
 - (p) The national primary drinking water regulations (b) lists a treatment technology action level of 1.3 mg/l as the MCL for Copper. Therefore, the secondary value is not used.
 - (u) See footnote (b). Treatment technology action level.
 - (a) NAC 445A.455 Secondary standards. Certain provisions of the National Primary Drinking Water Regulations are adopted by reference (NAC 445A.4525). These values are listed in the first column of this table and are therefore not listed again here. Only NAC 445A.455 Secondary standards are listed.

Notes:

1. ENSR, 2007, Phase A Source Area Investigation Results, Tronox Facility - Henderson, Nevada, September 2007.
2. U.S. EPA Maximum Contaminant Level (MCL) values unless noted
 - (gg) Value for 1,3-dichloropropene used as surrogate for 1,1-dichloropropene, cis-1,3-dichloropropene and trans-1,3-dichloropropene based on structural similarities.
 - (hh) Value for 1,2,4-trichlorobenzene used as surrogate for 1,2,3-trichlorobenzene based on structural similarities.
 - (ii) Value for 1,2-dichloropropane used as surrogate for 2,2-dichloropropane based on structural similarities.
 - (nn) Value for methyl isobutyl ketone used as surrogate for 2-hexanone based on structural similarities.
 - (ww) Value for 2-chlorotoluene used as surrogate for 4-chlorotoluene based on structural similarities.
 - (qq) Value for bromodichloromethane used as surrogate for bromochloromethane due to structural similarities.
 - (o) See footnote (b). Listed under synonym monochlorobenzene.
 - (xx) Value for methylene bromide used as surrogate for dibromomethane based on structural similarities.
 - (kk) Value for methyl tertbutyl ether (MTBE) used as surrogate for ethyl-tert-butyl ether (ETBE) based on structural similarities.
 - (a) NAC 445A.455 Secondary standards. Certain provisions of the National Primary Drinking Water Regulations are adopted by reference (NAC 445A.4525). These values are listed in the first column of this table and are therefore not listed again here. Only NAC 445A.455 Secondary standards are listed.

Notes for Phase A Data Tables

Manganese Leach Plant Area Including Mn Ore Piles, Anolyte Tanks, Sulfuric Acid Tanks, Leach Tanks and Transfer Lines
Tronox Facility - Henderson, Nevada

Blank	Not analyzed.
Bold	Bold values are constituents detected above the laboratory sample quantitation limit.
Gray	Grayed out values are non-detected values with the laboratory sample quantitation limits shown.
B	The result may be a false positive totally attributable to blank contamination.
D	Dissolved Metals.
DO	Dissolved Oxygen.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
J-	The result is an estimated quantity and the result may be biased low.
J+	The result is an estimated quantity and the result may be biased high.
JB	The result may be biased high partially attributable to blank contamination.
JK	The result is an estimated maximum possible concentration.
R	The result was rejected and unusable due to serious data deficiencies. The presence or absence of the analyte cannot be verified.
S	Soluable metals
T	Total Metals.
U	The analyte was analyzed for, but was not detected above the laboratory sample quantitation limit.
UJ	The analyte was not detected above the laboratory sample quantitation limit and the limit is approximate.
mg/kg	Milligrams per kilogram.
mg/L	Milligrams per liter.
ml/min	Milliliters per minute.
ng/kg	Nanogram per kilogram.
nm	Not measured.
NTUs	Nephelometric Turbidity Units.
ORP	Oxidation-reduction potential.
pCi/g	PicoCuries per gram.
pci/L	PicoCuries per liter.
s/gPM10	Revised protocol structures per gram PM10 fraction dust.
TEF	Toxic Equivalency Factor.
TEQ	Toxic Equivalent Concentration
ug/kg	Micrograms per kilogram.
ug/L	Micrograms per liter.
umhos/cm	MicroSiemens per centimeter.
L	Sample ID suffix indicating the sample was collected using low low-flow pumping rates (100-150 ml/min).
F	Sample ID suffix indicating the sample was collected using low-flow pumping rates (150-480 ml/min) and field filtered.
Z	Sample ID suffix indicating the sample was collected using low-flow pumping rates (150-480 ml/min)
*	No analytical data is available for this sample due to a laboratory error.
(a)	Calculated assuming 0 for non-detected congeners and 2006 toxic equivalency factors (TEFs).
(b)	Calculated assuming 1/2 detection limit as proxy for non-detected congeners and 2006 TEFs.
--	Not established
