

TECHNICAL MEMORANDUM

To: Nevada Environmental Response Trust

Cc: Nevada Division of Environmental Protection
United States Environmental Protection Agency

From: Dan Pastor and Dana Grady

Date: May 9, 2019

Subject: Seep Well Field Area Bioremediation Treatability Study Quarterly Progress Report

At the direction of the Nevada Environmental Response Trust (NERT or Trust), Tetra Tech, Inc. (Tetra Tech) has prepared this memorandum which summarizes Tetra Tech's progress from January through March 2019 toward successfully implementing the Seep Well Field (SWF) Area Bioremediation Treatability Study.

Task Progress Update: January – March 2019

Task M11 – Seep Well Field Area Bioremediation Treatability Study (SWFTS)

- Task Leader – Dana Grady/Dan Pastor
- Current Status
 - *Treatability/Pilot Study Modification No. 6 – Seep Well Field Area Bioremediation Treatability Study* (Mod 6) was submitted to the Nevada Division of Environmental Protection (NDEP) on December 11, 2018 to recommend continuation of the study to evaluate long-term injection frequencies and injection well maintenance requirements. This modification was approved by NDEP on December 14, 2018. Performance of this scope remains ongoing. As part of this modification, progress reports are now submitted on a quarterly basis. Therefore, this is the first quarterly progress report submitted as part of Mod 6.
 - The first groundwater sampling under Mod 6 was performed in December 2018/January 2019. Results of this groundwater sampling event (approximately six months following the third injection event) are summarized below. For reference, the attached Figure 1 provides a map of the injection and monitoring well locations and includes the baseline groundwater potentiometric surface. Well construction details and a summary of the groundwater analytical results for perchlorate, chlorate, nitrate, total organic carbon (TOC), and dissolved oxygen through January 2019 are provided in Tables 1 and 2, respectively.
 - Effectiveness monitoring results continue to indicate that perchlorate concentrations remain at levels significantly below their respective baseline concentrations in groundwater samples collected from the monitoring wells between and downgradient of the injection well transects (with baseline concentrations ranging from 2,400 to 23,000 micrograms per liter [$\mu\text{g}/\text{L}$] and December 2018/January 2019 concentrations ranging

from less than 15 µg/L to 6,300 µg/L). Specifically, 18 of the monitoring wells located in between or downgradient of the injection well transects continued to observe a greater than 50% reduction in groundwater perchlorate concentrations. Of these 18 monitoring wells, groundwater samples from eight wells observed a greater than 75% reduction in perchlorate concentrations when compared to baseline concentrations. Certain downgradient wells, such as SWFTS-MW9B and PC-94, had relatively stable concentrations compared to the previous sampling events following the third injection event. Perchlorate in groundwater samples collected from SWFTS-MW10A appeared to increase slightly as did perchlorate in groundwater samples from SWFTS-MW05B. Therefore, it appeared that a follow up injection event would be needed to optimize and maximize perchlorate degradation in groundwater in downgradient areas.

- Groundwater samples collected from monitoring wells between the injection well transects continue to indicate perchlorate concentration decreases, including concentrations in groundwater samples from monitoring wells SWFTS-MW14 and SWFTS-MW16 at less than 0.95 µg/L and 270 µg/L, respectively. Groundwater samples from SWFTS-MW02 and SWFTS-MW15 also continued to show decreases in perchlorate concentrations when compared to baseline, including the lowest concentrations to date at both wells during the December 2018/January 2019 event (620 and 5,300 µg/L, respectively). Perchlorate concentrations in groundwater samples collected from monitoring well SWFTS-MW16 remain significantly lower (greater than 97 percent lower) compared to baseline, although perchlorate concentrations during the September, October, and December sampling events were slightly higher than immediately after the third injection event.
- Groundwater samples collected from monitoring wells downgradient of the injection well transects also continue to indicate perchlorate concentration decreases similar to those observed following the first injection event, with nearly all downgradient monitoring wells showing at least a 50% reduction and five monitoring wells showing greater than 75% reduction.
- Chlorate concentrations in groundwater follow decreasing trends similar to perchlorate, with 12 downgradient monitoring wells exhibiting greater than 80% reduction in chlorate concentrations in groundwater when compared to baseline. This includes five locations (PC-91, SWFTS-MW03, SWFTS-MW10A, SWFTS-MW14, and SWFTS-MW16) where chlorate concentrations in groundwater were less than 100 µg/L following the third injection event.
- Nitrate concentrations in groundwater were also evaluated since it is the most likely competing electron acceptor and carbon substrate consumer. Nitrate concentrations in groundwater were generally greater than 10 milligrams per liter (mg/L) during the baseline sampling event. Groundwater from several downgradient monitoring wells continued to have low nitrate concentrations, with samples from 5 monitoring wells having nitrate concentrations less than 1 mg/L. However, the average nitrate concentration in groundwater from downgradient monitoring wells during the December 2018/January 2019 sampling event was 7 mg/L, which is slightly higher than the average concentrations observed during previous events. This may signal the gradual depletion of carbon substrate in the groundwater and the need for an additional injection event because nitrate is the favored electron acceptor for microbial respiration. Increasing nitrate concentrations is often an indication that carbon substrate is beginning to be a limiting factor for perchlorate biodegradation.

- The fourth injection event began on January 21, 2019 and was completed on February 10, 2019. The carbon substrate quantities that were injected were similar to quantities during the first and third injection events. A total of 83,760 gallons of carbon substrate injectate solution was added during the fourth injection event. Following the injections of the carbon substrate solution, a total of 314,865 gallons of chase water was injected into the aquifer to enhance carbon substrate distribution. Summary tables of injection well construction details and injection quantities and rates during the fourth injection event are provided in Tables 3 and 4, respectively.
- Of the 25 injection wells used for the four injection events, only two wells (SWFTS-IW13B and SWFTS-IW19) did not accept injectate additions at the maximum allowable pressure of 35 pounds per square inch (psi) during the fourth injection event. Injection pressures in injection well SWFTS-IW13B showed a gradual upward trend over the first three injection events, and based on this trend, it was expected that this well could require rehabilitation at some point. However, increasing injection pressures were not previously observed for injection well SWFTS-IW19, with injection rates in the third injection event observed at consistent flows that exceeded 6 gallons per minute at approximately 10 psi. Therefore, the injection pressures observed at this injection well appear to be an anomaly that will be further evaluated. Based on the observations during the fourth injection event, these two injection wells will likely be rehabilitated in the near future. Implementing and evaluating injection rehabilitation is an objective of the extended SWF treatability study operations.
- Prior to the next injection event, groundwater samples from injection wells SWFTS-IW13B and SWFTS-IW19 will be collected and analyzed for inorganic and organic composition. Analyses will quantify the solids content and percentage of organic material, which could include biomass and breakdown organic compounds from the emulsified vegetable oil (EVO) addition, as well as the content and types of inorganic cations. Understanding the biomass and EVO breakdown components in the water samples is key to determine if and when rehabilitation methods are required. Biomass has a dual value in being essential to degrade perchlorate while at the same time can serve as a source of organic carbon and biodegrade itself over time. Additionally, because the EVO that is injected moves radially around the injection well, some of the solids could include breakdown products that linger in the immediate vicinity of the formation but also get consumed over time. Therefore, an understanding of the composition of the groundwater samples collected from these injection wells is important to evaluate these possibilities of natural breakdown and flushing. In addition, a downhole video survey will be completed at each well to document the condition of the injection well screen.
- A decision to rehabilitate the two injection wells, SWFTS-IW13B and SWFTS-IW19, and the method of rehabilitation will be made once the groundwater samples collected from these injection wells and the video logs are analyzed and evaluated by Tetra Tech and the Trust. As described in the Treatability/Pilot Study Modification No. 6 – Seep Well Field Area Bioremediation Treatability Study, if rehabilitation is required, conventional well redevelopment (swabbing/scrubbing/surging or jetting with water), shock chlorination via the application of chlorine dioxide or other chemicals, and/or the addition of acidic agents may be evaluated to determine the most appropriate rehabilitation technique. This is an important maintenance component for ISB operations that could apply to future studies and long-term implementation.
- Groundwater sampling was performed approximately two weeks following completion of the fourth injection event, during the week of February 25, 2019. Results from this sampling event will be summarized in the next quarterly progress report after the data have been reviewed and validated.
- Schedule and Progress Updates
 - This task remains on schedule. The next groundwater sampling event is planned for April 2019.

- The SWF Area Bioremediation Treatability Study Results Report was submitted on May 6, 2019. This report includes a summary of activities and results for all work completed as part of the original study. A summary of activities and results of the work associated with Mod 6 will be presented in quarterly progress reports and an annual performance report.
- Health and Safety
 - There were no safety incidents related to Task M11 during the reporting period from January through March 2019.

CERTIFICATION

Seep Well Field Area Bioremediation Treatability Study Quarterly Progress Report

Notes:

mg/L - milligrams per liter

ug/L - micrograms per liter

-- not analyzed

< The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.

J The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

J+ The result is an estimated quantity, but the result may be biased high.

J- The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

UJ The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

E Instrument error during sampling
