Date: June 27, 2022

Subject: Las Vegas Wash Bioremediation Pilot Study Monthly Progress Report

At the direction of the Nevada Environmental Response Trust (NERT or Trust), Tetra Tech, Inc. (Tetra Tech) has prepared this memorandum to summarize Tetra Tech's progress during May 2022 toward successfully implementing the Las Vegas Wash Bioremediation Pilot Study (referred to herein as Pilot Study).

Task Progress Update: May 2022

Task M19 – Las Vegas Wash Pilot Study

- Study Status – Through completion of the three planned injection events and the associated effectiveness monitoring program, the data collected to date support the study defined objectives. Because in-situ bioremediation (ISB) has already been successfully demonstrated to remediate perchlorate and chlorate to site cleanup levels, the Pilot Study includes an effectiveness monitoring program to evaluate the implementation and operational components of a large-scale ISB program in this geologically complex area that includes injections into the alluvium, Upper Muddy Creek formation (UMCf), and UMCf-coarse grained (UMCf-cg). Specifically, data collected during the pilot study will be used to assess ISB application within a large paleochannel, injection protocols and frequency, achievable injection rates and subsurface distribution in varying lithologies, injection well construction methods and associated spacing, evaluation of vertical gradients, and comparison of ISB effectiveness between the alluvium, UMCf, and UMCf-cg. Although the effectiveness monitoring program is ongoing and a detailed analysis of the study results will be provided in the final Las Vegas Wash Bioremediation Pilot Study Results Report, valuable data have been collected thus far to properly evaluate the pilot study objectives and allow for a detailed technology review in the Feasibility Study. A brief summary of the injections and effectiveness monitoring program are presented below.
 - *Injections* – The first injection event was completed in December 2020 and included injections into all three pilot study zones (Zones 1, 2, and 3) within the alluvium and/or UMCf. The second injection event was completed in April 2021 and included injections into only the Zone 2 alluvium. The third injection event was completed in October 2021 and included injections into all three remediation zones (Zones 1, 2, and 3) within the alluvium and/or UMCf. Summaries of the three

injection events were provided in the January 2021, April 2021, and October 2021 monthly progress reports, respectively. A layout map and construction details of all injection, monitoring, and extraction wells are provided on Figures 1 through 4 and Table 1.

- *Effectiveness Monitoring* – The effectiveness monitoring program has consisted of baseline groundwater sampling that was completed in the fall of 2020 prior to the first injection event, followed by weekly and monthly groundwater sampling events following injections. The monitoring program described in the NDEP-approved Las Vegas Wash Bioremediation Pilot Study Work Plan Addendum (referred to as Work Plan Addendum) was subsequently implemented to evaluate the effectiveness and implementability of ISB in varying lithologies. As part of this monitoring program, groundwater sampling was conducted on a biweekly basis for the Zone 2 alluvium for the first two months after the first injection event, followed by monthly sampling thereafter, which is ongoing. Groundwater sampling for the UMCf and UMCf-cg in Zones 1, 2, and 3 was conducted monthly during the first four months following the first injection event. In accordance with the Work Plan Addendum, groundwater sampling frequencies in the UMCf and UMCf-cg were reduced to a bimonthly basis approximately four months after the first injection event (beginning in May 2021) due to the slower groundwater flow rates present in the UMCf/UMCf-cg. Monthly sampling of the UMCf/UMCf-cg in all three zones resumed in November 2021 following the October 2021 injections. Bi-monthly sampling of monitoring wells screened in the UMCf/UMCf-cg resumed in March 2022.

Available groundwater analytical results from the baseline sampling event and subsequent effectiveness monitoring events performed from December 2020 to April 2022 are provided on Table 2. The April 2022 groundwater results from key cross-gradient and downgradient monitoring wells located within Zones 2 alluvium are summarized below. Groundwater analytical results from the most recent sampling event performed from May 16, 2022 through May 20, 2022 will be provided in future monthly progress reports as the data are received from the laboratory.

- Zone 2 Alluvium:
 - Groundwater samples collected from all four cross-gradient monitoring wells (LWPS-A2-MW04A/B and LWPS-A2-MW05A/B; located approximately 17 feet from each end of the Zone 2 injection well transect) continue to indicate perchlorate concentration decreases approximately 6 months after the third injection event. Groundwater collected from deeper cross-gradient monitoring wells LWPS-A2-MW04B and LWPS-A2-MW05B continue to indicate concentration decreases of greater than 99 percent when compared to baseline concentrations while groundwater at the two shallow cross gradient wells LWPS-A2-MW04A and LWPS-A2-MW05A indicated reductions of approximately 60 percent compared to baseline concentrations.
 - Groundwater samples collected from 11 of the 14 monitoring wells located approximately 50 to 100 feet downgradient from the injection well transect also continued to indicate perchlorate concentration decreases during the April 2022 sampling event. Additionally, perchlorate concentrations in samples collected from three of the 14 monitoring wells indicated a greater than 97 percent reduction compared to baseline conditions, two of which indicated perchlorate concentrations below the perchlorate Preliminary Remediation Goal (PRG) of 15 µg/L.
 - Groundwater samples collected in April 2022 from monitoring well LWPS-MW223B, which is located approximately 200 feet downgradient from the injection well transect, indicated a perchlorate concentration decrease of 94 percent when compared to baseline concentrations.

- Groundwater samples collected from the four cross-gradient monitoring wells indicated a greater than 89 percent decrease in chlorate concentrations compared to baseline. Additionally, groundwater samples collected from 17 of the 18 monitoring wells located between 50 and 250 feet downgradient from the injection well transect indicated reductions in chlorate concentrations of greater than 86 percent, with 16 of those wells indicating groundwater chlorate concentration reductions of greater than 99 percent.
- Nitrate concentrations in groundwater were also evaluated because it is often a competing and preferred electron acceptor and carbon substrate consumer. Nitrate concentrations in groundwater samples collected from Zone 2 alluvium monitoring wells averaged 17 milligrams per liter (mg/L) during the baseline sampling event. During the April 2022 sampling event, groundwater samples collected from 12 of the 22 cross-gradient or downgradient monitoring wells indicated nitrate concentrations of less than or equal to 10 mg/L, with groundwater samples collected from six of these 22 monitoring wells indicating nitrate concentrations of less than or equal to 1 mg/L.
- Zone 1, 2, and 3 UMCf/UMCf-cg:
 - Zone 1 UMCf – Approximately six months following the October 2021 (second) injection event into Zone 1 UMCf, groundwater samples collected from monitoring wells LVWPS-U1-MW08A/B, which are located approximately 25 feet downgradient from the injection well transect, indicated decreases in perchlorate concentrations of greater than 98 percent, when compared to baseline concentrations. In addition, the groundwater samples collected from monitoring well LVWPS-U1-MW09B, which is located approximately 100 feet downgradient continued to indicate a reduction in perchlorate concentration of 59 percent compared to baseline conditions. Lastly, reductions also continued to be observed in groundwater samples collected from two upgradient monitoring wells, namely LVWPS-U1-MW06B and LVWPS-U1-MW07, which were expected based on the low effective porosities observed during injection activities and the effectiveness monitoring results following the first injection event. Low effective porosity causes the injectate solution to move farther from the injection points (both upgradient and downgradient) during injections, particularly when injecting under pressure. Nitrate and chlorate concentrations followed a similar pattern to perchlorate.
 - Zone 2 UMCf – Approximately six months following the October 2021 (second) injection event into Zone 2 UMCf, groundwater samples collected from cross-gradient monitoring wells LVWPS-U2-MW04 and LVWPS-U2-MW05, which are screened in the UMCf and located approximately 12 feet from each end of the Zone 2 injection well transect, continue to indicate perchlorate concentrations less than the perchlorate PRG of 15 µg/L, which represents a reduction of greater than 99 percent compared to baseline concentrations. Additionally, groundwater samples collected from LVWPS-U2-MW18, which is located 25 feet downgradient from the injection well transect, continued to indicate a perchlorate reduction of 95 percent compared to baseline concentrations during the April 2022 sampling event. Groundwater samples collected from seven of the remaining eight downgradient monitoring wells all indicate perchlorate reductions, with samples collected from monitoring wells LVWPS-U2-MW14 and LVWPS-MW223C indicating concentration reductions of 64 and 67 percent,

respectively. The observation at LVWPS-MW223C compared to observations at UMCf monitoring wells located closer to the injection well transect is likely indicative of a preferential flow path in this vicinity. Lastly, a reduction in perchlorate concentration to less than the perchlorate PRG of 15 µg/L was also observed in the groundwater sample collected from upgradient monitoring well LVWPS-U2-MW02, following the second injection event into Zone 2 UMCf. As previously explained in the Zone 1 discussion, this was expected based on the low effective porosities observed during injection activities, which cause the injectate solution to move farther from the injection points (both upgradient and downgradient) during injections, particularly when injecting under pressure. Nitrate and chloride concentrations followed a similar pattern to perchlorate.

- Zone 3 UMCf-cg – Approximately six months following the October 2021 (second) injection event into Zone 3 UMCf-cg, groundwater samples collected from two of the six monitoring wells located approximately 25 feet downgradient indicated a greater than 99 percent reduction in perchlorate concentrations compared to baseline, with concentrations less than the perchlorate PRG of 15 µg/L. In addition, groundwater samples collected from monitoring well LVWPS-U3-MW10B, which is located approximately 100 feet downgradient from the Zone 3 injection well transect, continued to indicate greater than 99 percent reduction in perchlorate, with concentrations below the 15 µg/L PRG. The groundwater sample collected from LVWPS-U3-MW12B, which is located approximately 150 feet downgradient, continued to indicate decreasing perchlorate concentrations, with a perchlorate concentration decrease of 83 percent compared to baseline. Nitrate and chloride concentrations followed a similar pattern to perchlorate.
- Surface water sampling in the Las Vegas Wash was performed prior to injection activities on October 16, 2020 and October 29, 2020. Eighteen surface water sampling events have been performed on a monthly basis since the study began. Although limited surface water sampling has been and will continue to be periodically conducted downgradient from the study area, reducing perchlorate concentrations in surface water is not an objective of this pilot study. In general, perchlorate concentrations in surface water continue to fluctuate with some concentration decreases observed downstream of the pilot study area that may correlate with the timing of the periodic injection events performed as part of this pilot study. Further data evaluation is warranted to correlate these observations with the pilot study activities. An evaluation of surface water concentration trends during the pilot study timeframe will be provided in the forthcoming Las Vegas Wash Bioremediation Pilot Study Results Report. No significant decreases in perchlorate concentrations in surface water were observed in the April 2022 sampling event.
- Access and Permitting
 - All access agreements and permits are in place for the pilot study activities.
- Schedule and Progress Updates
 - The third injection event was completed in October 2021. No additional injection events are planned as part of the pilot study.
 - The final monthly effectiveness monitoring event is scheduled to begin on June 13, 2022 and will include sampling of all monitoring wells screened in the alluvium and UMCf/UMCf-cg in all three zones.
 - The final aquifer testing event will be performed the week of June 20, 2022.

- **Health and Safety**
 - There were no safety incidents related to Task M19 during May 2022.

CERTIFICATION

Notes

amsl - above mean sea level

bgs - below ground surface

bTOC - below top of casing

PVC - polyvinyl chloride

UMCf - Upper Muddy Creek formation

UMCf-cg - Upper Muddy Creek formation - coarse grained facies

UMCf/Horse Springs- Alternating layers of UMCf, semi-consolidated UMCf, and reworked Horse Springs formation.

UMCf (Semi-Cons) - Semi-consolidated Upper Muddy Creek formation

--- Not Applicable

1. Depth to water measurements collected in October 2020.

2. Well names including IW indicate an injection well. Well names including DR indicate a dose response well. Well names including MW indicate a monitoring well. Well names including EW indicate an extraction well.

Notes:

- Not tested.
- < The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.
- E Instrument error during field test.
- FD Field Duplicate
- J The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
- J- The result is an estimated quantity, but the result may be biased low.
- J+ The result is an estimated quantity, but the result may be biased high.
- N Normal Field Sample
- N/A Not Applicable.
- R The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.
- Transect Distance Approximate distance from Injection Well Transect in feet.
- UJ The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.
