Subject: Phase 2 Sampling and Analysis Plan to Conduct Soil Characterization, Tronox

Parcel "F" Site, Henderson, Nevada

#### Dear Shannon:

On behalf of Tronox, Basic Environmental Company (BEC) appreciates the opportunity to submit this letter Phase 2 Sampling and Analysis Plan (SAP) to conduct soil characterization of the Tronox Parcel "F" (portions of APN No. 178-12-401-009). Parcel F will be referred to as the Site for the purposes of this SAP. The Site is located within the Tronox facility, approximately 1/2 mile north of Lake Mead Parkway, in Henderson, Nevada. Figure 1 illustrates the location of the subject Site relative to the Tronox property. Figure 2 shows details of Parcel F. Legal boundaries of Parcel F will be provided to the Nevada Division of Environmental Protection (NDEP) prior to issuance of the requested No Further Action Determination (NFAD).

## **Background**

The Site, which represents a portion of the Tronox property, is comprised primarily of vacant land, and includes portions of a building foundation. A remediation project was recently completed on the Parcel directly north of this Parcel (by TIMET). The parcel to the north was contaminated with PCBs from electrical equipment. There are also several aboveground storage tanks to the south of the Site. Tronox indicates that these are at a different elevation – and therefore there is limited possibility that spills from the tanks would have affected the surface to 10 foot elevation of the Site. In addition, the former Hardesty Chemical/ AMECCO operation may have occurred directly south of the Site. BEC also recognizes that other historic uses/disposals on or near the Site may have occurred. A Phase 1 investigation has been performed on the Site. The Phase 1 investigation, Site visits and historical aerial photographs analysis indicate the presence of staining and debris. Electrical equipment is also located on the Site in a fenced area. Given the vicinity of BMI Industrial Companies, it is also possible that the Site or portions thereof could also have been indirectly impacted by such operations.

Several monitoring wells are located within the Site, which are used by several of the BMI plant operating companies. For example, Stauffer Management Company LLC (Stauffer), Montrose Chemical Corporation of California (Montrose), Syngenta Crop Protection, Inc., and Pioneer Americas, LLC (the Companies) conducted quarterly groundwater samples from one alluvial aquifer monitoring well within the property (TR-6). Chemicals concentrations were generally low or non-detect; however, chloroform was detected at 2,500 parts per billion (ppb).

This SAP will focus on the upper five feet of soil in order to obtain a NFAD from the NDEP in order to support future industrial/commercial use on this Site. No residential use is planned. The rationale for sampling for the upper five feet (as opposed to the upper 10 feet) is that imported fill of roughly five feet depth will be required in order to meet final site grading requirements. This fill will be clean. One possible source is material from the BRC Borrow Pit.

## **Objective**

The objective of the field investigation is to identify and characterize the distribution of Site-related chemicals (SRCs) in the vicinity of the future land use features (e.g., warehouses, commercial office buildings) and historical site features (e.g., electrical equipment storage, debris piles, etc.). Surface and shallow subsurface samples that will be collected are depth-discrete soil matrix samples. Sample locations have been placed to both evaluate potential future land use exposures (although future plans are not fully defined at this time), and to characterize potential source areas on the Site. The sample locations provide spatial coverage of the Site (Figure 2). The rationale for location of the sampling points is to ensure that the entire Site is reasonably and completely covered for sampling purposes in order to obtain data that are representative of the Site, that specific locations within the Site that were potentially impacted are also sampled, and that the sampled concentrations can be meaningfully used in subsequent risk assessments, if needed. Ultimately, the purpose of this sampling is to support the NFAD for Parcel F.

## **Scope of Work**

The following is the proposed scope of work for investigating the Site and meeting the SAP objectives. The scope of work has been divided into three main tasks: 1) Field Implementation; 2) Data Evaluation; and 2) Reporting.

## Task 1: Field Implementation

The purpose of the intrusive investigation is to collect data sufficient to meet the objectives of the SAP. All sampling and sample handling procedures will be consistent with the NDEP-approved BRC Field Sampling and Standard Operating Procedures (FSSOP) (BRC and MWH 2006a).

The proposed analyte list is composed of VOCs, semi-volatile organic compounds (SVOCs), total petroleum hydrocarbons (TPH), polyaromatic hydrocarbons (PAHs), polychlorinated biphenyls (PCBs), dioxins/furans, metals, organochlorine pesticides, perchlorate, ions (including chloride, nitrate, nitrite, and sulfate), radionuclides, and asbestos. This list includes all of the compounds (with a few additional modifications as discussed subsequently) on Tronox's "reduced list" as shown in Table 1. Tronox's reduced list was developed as a subset of the entire suite of Tronox SRCs based on the findings of the Tronox Phase A Source Area Investigation. The modifications are as follows: first, in general instead of analyzing for specific members of certain analyte categories like metals, VOCs and SVOCs, the entire suite will be analyzed and reported; second, the organophosphate pesticide and chlorinated herbicide suites were eliminated since only three detections were in these analytical suites (dimethoate and demeton-o) which were at least an order of magnitude below their respective U.S. Environmental Protection Agency (USEPA) Region 9 industrial preliminary remediation goals (PRGs); third, not all SRCs are proposed to be analyzed at all depths in this SAP (for example, asbestos is proposed to be

analyzed in surface soil samples only); and lastly, although dioxins/furans are not on the Tronox SRC list, because they may potentially be present on the Site, they are also proposed for analysis in surface soil samples. Although only a single Aroclor was detected once in the Tronox Phase A Source Area Investigation, at 20 feet below ground surface (bgs) and below it's respective PRG, because PCBs may potentially be present on the Site (for example, in the electrical equipment area), they are retained for analysis in surface soil samples, given the proximity to the TIMET Parcel F portion which contained PCBs. Summary results of the Tronox Phase A investigation for PCBs, organophosphate pesticides, and chlorinated herbicides are provided in Table 2.

Given the absence of direct operations on this Site of a nature commensurate to that which took place on the Tronox plant site itself, the proposed SRC list and proposed sampling should characterize those sources that were located on the Site, as well as likely chemicals that may have been deposited on the Site via fugitive dust emissions from the Tronox operations and property and/or other neighboring BMI plants. The proposed analyte list for this SAP is presented in Table 1. Unless as otherwise noted above, all analytes will be analyzed at all locations. BEC notes that this analyte list may not be appropriate for any future planned investigations (such as the proposed Tronox Phase B investigation) at the Site (which will extend from 10 feet bgs to groundwater).

#### Pre-Field Activities

The pre-field activities will be conducted in accordance with applicable standard operating procedures (SOPs; BRC and MWH 2006a). The BRC Quality Assurance Project Plan (QAPP; BRC and MWH 2006b) and Health and Safety Plan (HASP; BRC and MWH 2005) prepared for the BMI Common Areas will be used for this proposed scope of work. All work will be completed under the direction of a State of Nevada Certified Environmental Manager.

## Soil Borings

The SOPs referred to in the following discussion are documented in the FSSOP. BEC will implement field screening using photoionization detectors (PIDs) (using two lamps) in accordance with SOP-39. SOP-1 will be followed for all drilling activities including Hollow Stem Auger drilling. The field geologist will prepare logs for each boring indicating the Unified Soil Classification System (USCS) soil classification (SOP-17), an estimate of field moisture content, sampling depths, progress of drilling (SOP-15), final completion depth, and the nature and resolution of any problems encountered.

Soil sample and auger boring locations will be surveyed using a handheld GPS to a horizontal accuracy of 3 meters (approximately 10 feet) or better. Soil cuttings generated during soil sampling and drilling activities will be collected on visqueen, analyzed, and appropriately disposed off. Due to the nature of the shallow sampling, it is not anticipated that a significant amount of excess soil will be generated as a result of the sampling, or that the soils will require special handling. Also, because the groundwater at the Site is generally 35 feet bgs, it is not anticipated that groundwater will be encountered during drilling of the shallow borings. The quality assurance/quality control (QA/QC) procedures that will be followed during the field investigation are detailed in Section B of the QAPP (BRC and MWH 2006b).

Soil matrix samples will be collected based on random sample locations placed within a 4-acre grid across the Site. The random sample locations were supplemented with judgmental sampling

locations targeting specific site features (e.g., miscellaneous pile locations). The rationale for the various judgmental sampling locations is provided below:

- Parcel F, grid cell 'F-A2' 55-gallon drum location;
- Parcel F, grid cell 'F-B1' above ground vault location;
- Parcel F, grid cell 'F-B2' electrical equipment location;
- Parcel F, grid cell 'F-B1' debris pile location;
- Parcel F, grid cell 'F-B1' debris pile location;
- Parcel F, grid cell 'F-A1' debris pile location; and
- Parcel F, grid cell 'F-A1' debris pile location.

Soil borings will be advanced with a hollow-stem auger to a total depth of five feet bgs. Soil samples will be collected at approximately zero (i.e., surface) and five feet bgs. Soil samples will be analyzed for the analyte list provided in Table 1, with limitations as noted in the footnotes to this table.

#### Task 2: Data Evaluation

Once the data are collected, BEC will subject the data to validation per procedures agreed to previously with the NDEP and consistent with the QAPP (BRC and MWH 2006b). Only those data determined by the QA/QC review to be suitable for use will be considered for the site data set. A separate Data Validation Summary Report will be prepared and submitted to NDEP.

# Task 2: Reporting

Upon receipt of laboratory analytical results, an investigation report will be prepared. The report shall contain, but not be limited to, the following items:

- A summary of the sampling procedures conducted;
- Sampling location map;
- Soil boring logs;
- An evaluation and summary of the collected data;
- Tables(s) summarizing soil results; and
- If appropriate, plan view maps indicating the locations of detected constituents in soil.

Given the depth to groundwater at the Site (approximately 35 feet bgs, as measured at on-site monitoring wells), and the fact that future development will cover the Site with paved areas and buildings, migration of chemicals at the Site to groundwater is considered unlikely. However, once the data are collected this will be evaluated in the report. It should also be noted that development of the site will not preclude future groundwater investigation or remediation activities that may need to be conducted by Tronox.

Following collection and analysis of soil samples, the data will be discussed with the NDEP. This will include a comparison to the recently approved BRC-TIMET background data set (TetraTech 2007). If required upon this evaluation, a risk assessment will be conducted to evaluate the potential risks to future on-site human receptors. The receptors identified to be evaluated in the risk assessment will be consistent with the proposed development of the Site.

These receptors will include construction workers, indoor commercial workers, and outdoor maintenance workers. Because the proposed development does not include residential units, onsite residents will not be evaluated. The risk assessment will be conducted using standard USEPA guidance, input parameters, and methods. A risk assessment work plan will be submitted to NDEP after sample results have been obtained and NDEP approval will be obtained prior to conducting the risk assessment.

## **Schedule**

Once final approval of the SAP is received from NDEP, field implementation activities can commence within one to two weeks. BEC will provide NDEP with at least one week notice prior to the initiation of field activities at the Site. It is anticipated that this work can be completed within one week, depending on field conditions. The soil samples will be submitted to the laboratories and placed on a standard turn around time, which is 28 days for the complete analyte list. A report will be completed within three weeks after the final data are received from the laboratory and validated.

## **Closing Remarks**

See attached for appropriate certification language and signature. Please direct any remaining questions or comments you may have to me at 626-382-0001.

Sincerely,

**Basic Environmental Company** 

Ranajit Sahu, CEM Project Manager

## Notes:

The laboratory will be instructed to report the top 25 Tentatively Identified Compounds (TICs) under method 8260B and 8270C.

<sup>&</sup>lt;sup>1</sup>PCBs, organophosphorous pesticides and chlorinated herbicides are not included in the analyte list. See text for rationale.

<sup>&</sup>lt;sup>2</sup>For polynuclear aromatic hydrocarbons, Method 8270C is the primary analytical method, but Method 8310 may be used if necessary.

<sup>&</sup>lt;sup>3</sup>Method 3540 for extraction and Method 3640 for cleanup are to be used as appropriate.
