MEMORANDUM

From: Deni Chambers, Principal-in-Charge
Derrick Willis, Project Manager

Date: July 9, 2010

To: Mr. Matt Paque, Tronox

RE: Manganese Tailings Pile Confirmation Sampling

The Nevada Division of Environmental Protection (NDEP) has requested that confirmation sampling be performed at the location of the former manganese tailings pile at the Tronox facility in Henderson, Nevada (the Site) following removal of the manganese tailings. Sampling will be conducted following procedures set forth in Northgate's Pre-Confirmation Sampling Work Plan¹ and the BMI standard operating procedures (SOPs)².

The objective of the sampling program is to confirm that manganese tailings are removed and that associated chemicals (manganese, cobalt and arsenic) are below the following screening levels. NDEP's basic comparison levels (BCLs) for manganese and cobalt are 13,700 and 331 milligrams per kilogram (mg/kg), respectively, and background concentration for arsenic is 7.2 mg/kg.

Soil samples will be collected using a slide-hammer sampler from 21 locations at a depth of 0-6 inches below ground surface (bgs) as shown on Figure 1. Nine of the sample locations will be placed in a grid pattern across the main portion of the manganese tailings area; four will be located along the eastern property boundary; two will be located along the west boundary of the tailings area; four will be located along the north boundary of the tailings area; and one each will be located beneath polygons Remediation Zones (RZ) -C-46 and -C-47 (northeast corner).

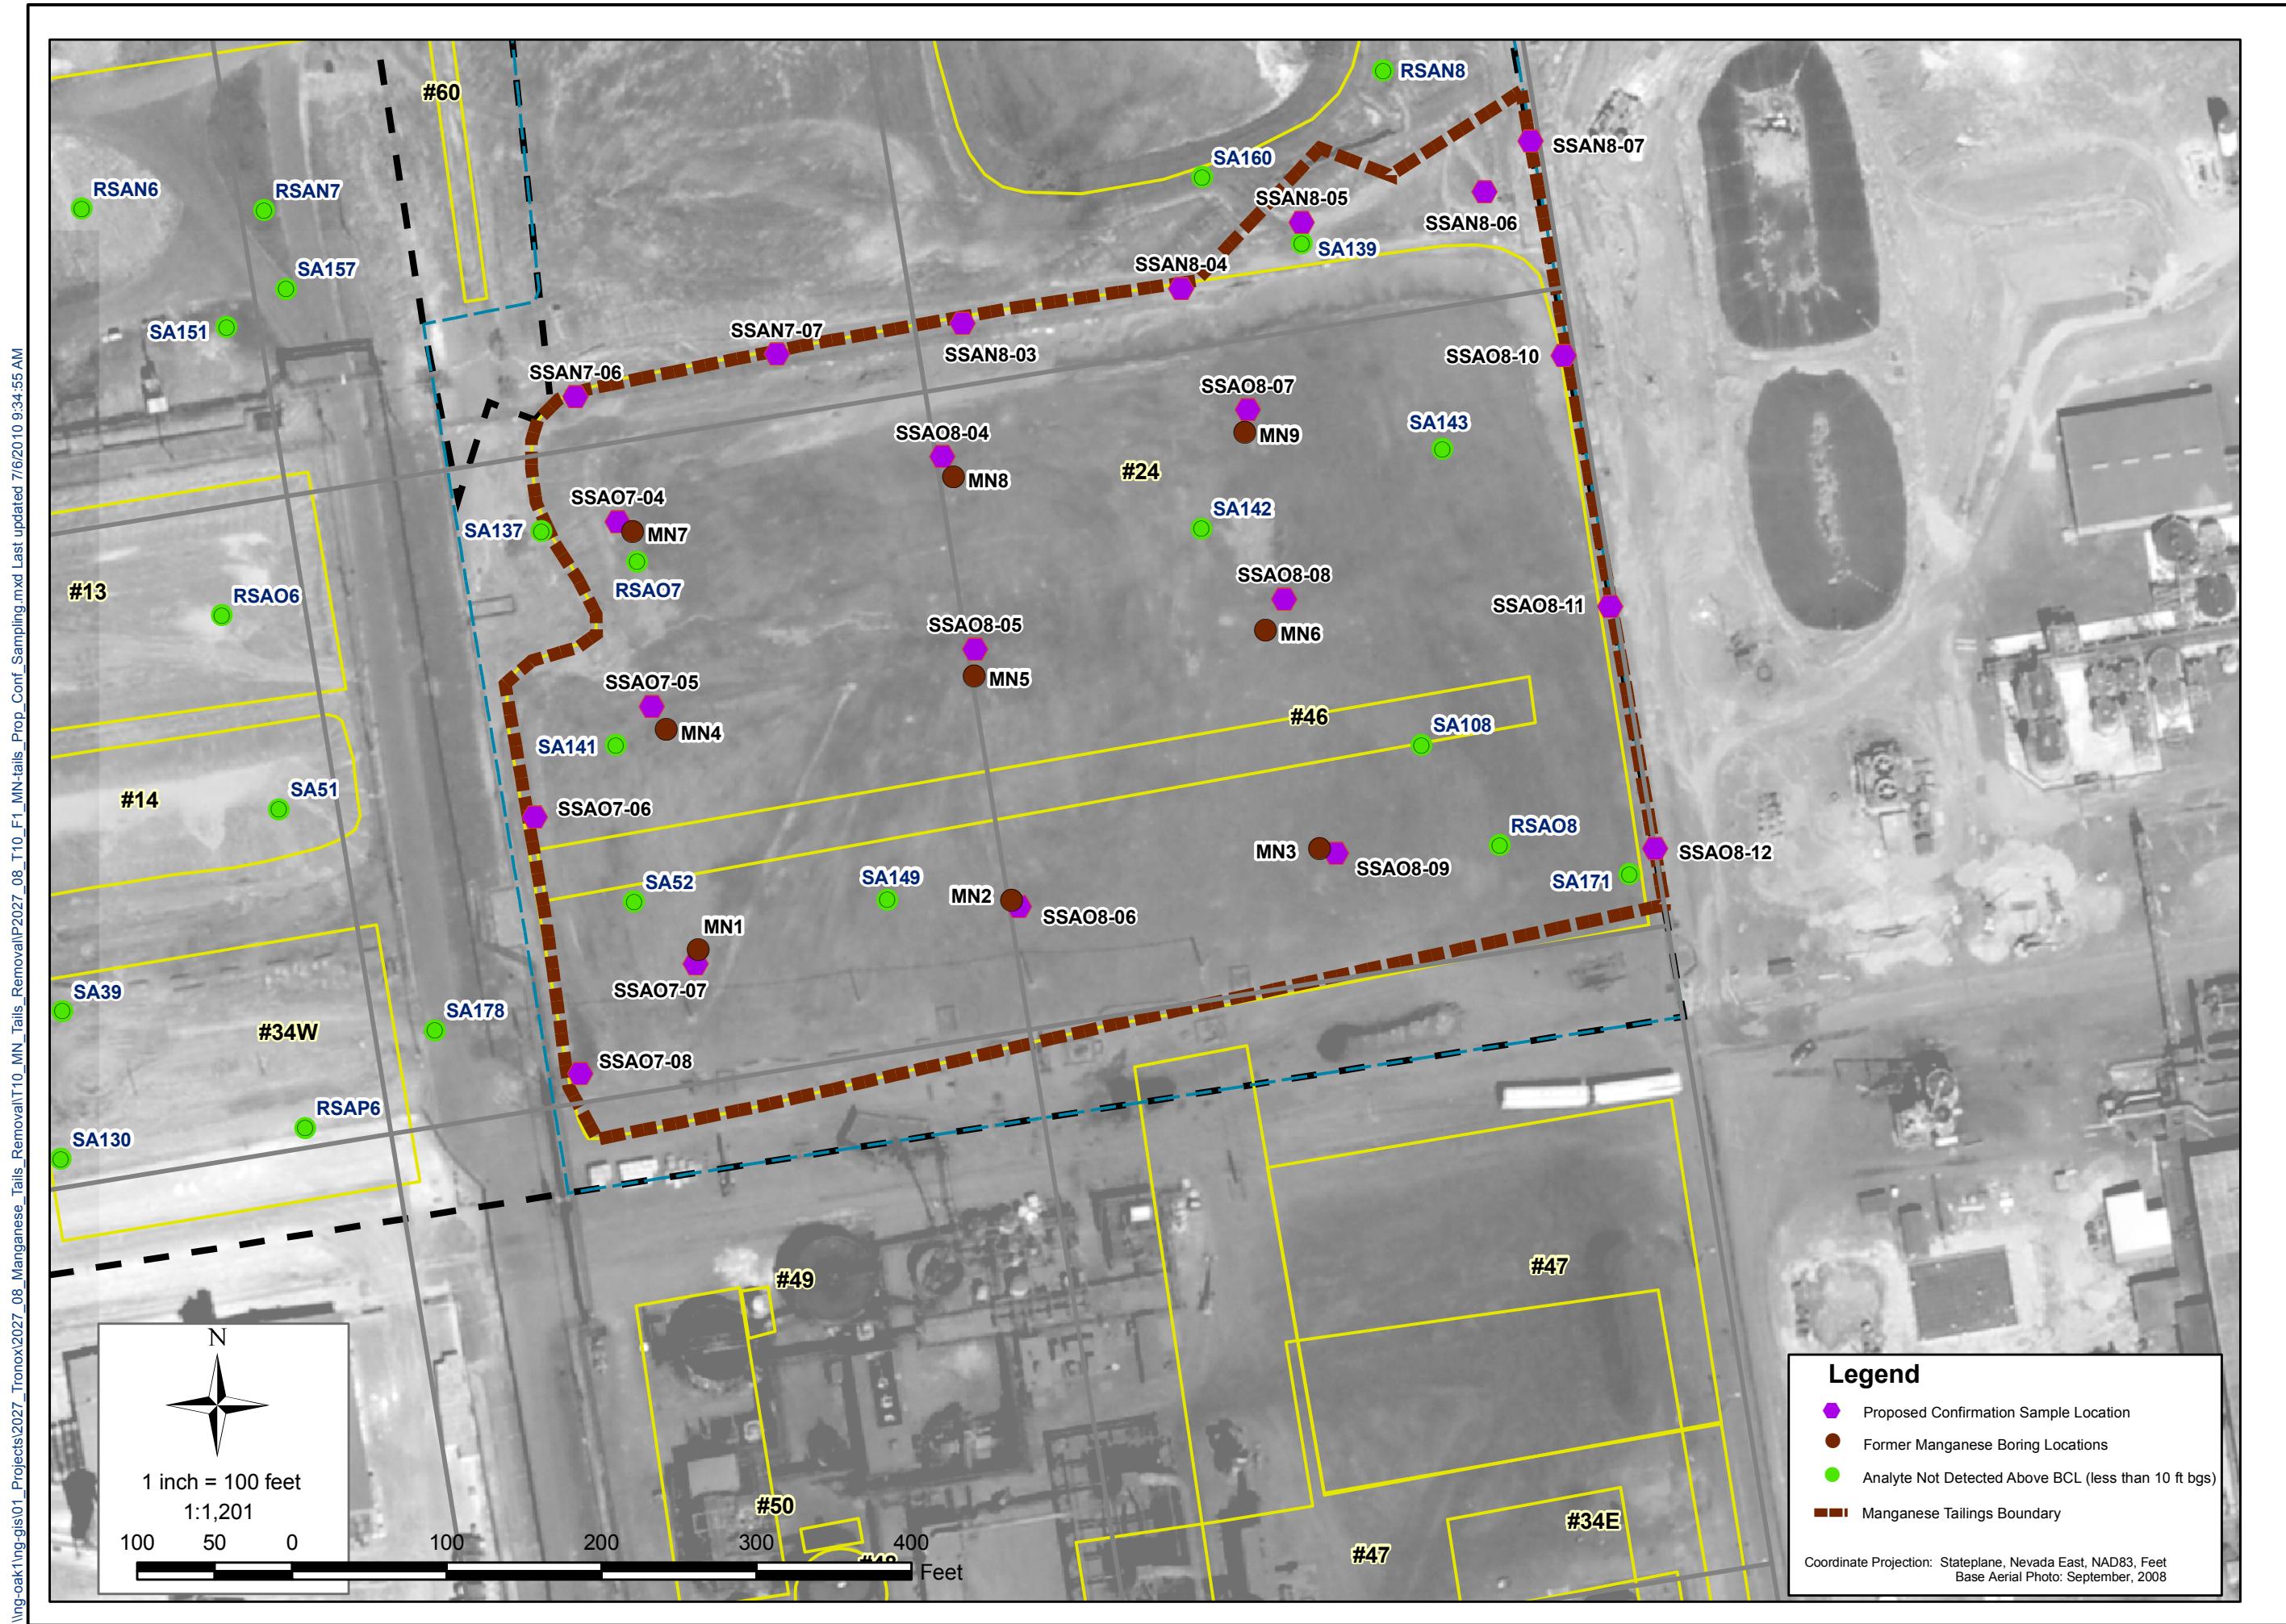

Additional samples will be collected from 6-12 inches bgs at each sampling location; these samples will be placed on hold pending receipt of analytical results of the shallow samples.

Results will be presented in the Human Health Risk Assessment and Closure report for RZ-C.

If you have any questions about this sampling program, please contact us.

Nevada Division of Environmental Protection (NDEP) Response to:
TRX Letter Submittal RE: Manganese Tailings Pile Confirmation Sampling
Dated: July 9, 2010

Dear Mr. Paque,

The NDEP has received and reviewed TRX's above-identified Deliverable and provides comments in Attachment A. A revised Deliverable should be submitted **by July 27, 2010** based on the comments found in Attachment A. TRX should additionally provide an annotated response-to-comments letter as part of the revised Deliverable.

Please contact the undersigned with any questions at sharbour@ndep.nv.gov or 775-687-9332.

Sincerely,

Shannon Harbour, P.E.

Attachment A

1. TRX should provide a brief background section discussing a CSM-based description of the manganese tailings pile area including history and a list of wastes and potential contaminants that were placed or occurred in this area. Please note that the liquids discovered during the excavation should be discussed for potential impact and targeted sampling.
2. During the Phase B Source Area Investigation, TRX collected samples from the surface (0.0-0.5 fbgs), 5 fbgs, and 10 fbgs; however, TRX is only proposing to sample at the surface and 0.5-1.0 fbgs interval. TRX should conduct the sampling of this area in a manner consistent with previous sampling that will be used in a Health Risk Assessment for this Remediation Zone.
3. TRX should justify the elimination of chemical analytical suites from the Phase B broad suite analysis using CSM-based discussion. All chemical suites used in Phase B should be sampled unless otherwise approved by the NDEP.
4. TRX should acknowledge and discuss the former cooling tower that is located in the manganese tailings area and how this area will be characterized.
5. TRX should also propose sampling on the southern boundary of the manganese tailings area.
6. Figure 1, NDEP provides the following comments:
 - a. Please clarify what the Manganese Boring Locations are and if samples were collected, please present the results.
 - b. Please provide the Phase B results in this Figure.

RE: Response to Nevada Division of Environmental Protection's July 20, 2010
Comments on TRX Letter Submittal RE: Manganese Tailings Pile Confirmation Sampling, dated July 9, 2010

Response to Comments

Northgate Environmental Management, Inc. (Northgate) submits this Response to Comments on the *TRX Letter Submittal RE: Manganese Tailings Pile Confirmation Sampling* on behalf of Tronox LLC (Northgate, July 9, 2010). Tronox has reviewed the following Nevada Division of Environmental Protection (NDEP) comments and has revised the submittal accordingly.

1. *TRX should provide a brief background section discussing a CSM-based description of the manganese tailings pile area including history and a list of wastes and potential contaminants that were placed or occurred in this area. Please note that the liquids discovered during the excavation should be discussed for potential impact and targeted sampling.*

Response: This revised document includes background information regarding the history of the manganese (Mn) tailings pile.

2. *During the Phase B Source Area Investigation, TRX collected samples from the surface (0.0-0.5 fbgs), 5 fbgs, and 10 fbgs; however, TRX is only proposing to sample at the surface and 0.5-1.0 fbgs interval. TRX should conduct the sampling of this area in a manner consistent with previous sampling that will be used in a Health Risk Assessment for this Remediation Zone.*

Response: As discussed in the July 23, 2010 NDEP-Tronox-Northgate Conference Call, eight borings were previously advanced in the Mn tailings area as part of the Phase B investigation, and deeper soil samples were collected from below the interface between the Mn tailings and native soil that characterize the soil as clean. These clean boring locations are shown on Figure 1. Soil samples collected from these borings were analyzed for the Phase B suite of analyses; therefore, analyzing the Mn tailings confirmation samples would be repetitious. The shallow surface samples proposed are to confirm that Mn tailings were successfully removed.

3. *TRX should justify the elimination of chemical analytical suites from the Phase B broad suite analysis using CSM-based discussion. All chemical suites used in Phase B should be sampled unless otherwise approved by the NDEP.*

Response: Please see Response to Comment 2.

4. *TRX should acknowledge and discuss the former cooling tower that is located in the manganese tailings area and how this area will be characterized.*

Response: The cooling tower (LOU 46) was investigated as part of the Phase B investigation with eleven borings to depths of approximately 40 feet below ground surface. Select samples were analyzed for perchlorate, metals, hexavalent chromium, radionuclides, total petroleum hydrocarbons, dioxin/furans, and asbestos in accordance with the NDEP-approved Phase B sampling and analysis plans.

5. *TRX should also propose sampling on the southern boundary of the manganese tailings area.*

Response: The southern boundary is an area of active operations. There is an active utility corridor that runs along this boundary precluding drilling. The area will be addressed in the future when operations cease and the utilities are no longer active. It should be noted that Phase B borings in the Mn tailings area indicate that soils are below basic comparison levels.

6. *Figure 1, NDEP provides the following comments:*

- a. *Please clarify what the Manganese Boring Locations are and if samples were collected, please present the results.*
- b. *Please provide the Phase B results in this Figure.*

Response:

- a. MN-1 through MN-9 were borings advanced through the Mn tailings for waste profiling characteristics. The borings were not advanced into soil. The Mn tailings characterization report is included as Attachment A.
- b. Figure 1 has been revised to show the Phase B sampling locations. Results from the Phase B sampling are presented in Table 2.

REVISED MEMORANDUM

From: Deni Chambers, Principal-in-Charge **Date:** July 27, 2010
Derrick Willis, Project Manager

To: Shannon Harbour, PE
Nevada Division of Environmental Protection

RE: Revised Manganese Tailings Pile Confirmation Sampling Memo

The Nevada Division of Environmental Protection (NDEP) has requested that confirmation sampling be performed at the location of the former manganese (Mn) tailings pile at the Tronox facility in Henderson, Nevada (the Site) following removal of the Mn tailings.

Description and Background

The Mn tailings area is located north of the Mn leach plant and south of Mn-1 Pond. The area is approximately 8.6 acres in size. The southern edge of the area is still active and Mn tailings are still present. A narrow concrete foundation for a former cooling tower traverses the area from west to east.

From 1975 to 2004, this area was used for the disposal of Mn tailings from the leach plant process which included the leach beds. Mn tailings material from all locations at the Site were consolidated to the current location and covered with soil sometime prior to 1985. The tailings pile was periodically graded to maintain the desired shape and drainage. Concrete removed from Unit 6 was also disposed in the Mn tailings pile. Since 2001 to 2004, Mn tailings have been removed and disposed at an appropriate landfill.

Removal of the tailings was completed on July 19, 2010. A total of 284,232 tons of Mn tailings and debris were removed from the area, of which 0.4% was debris consisting of a minor amount of wood (approximately 3-5 cubic yards) which appears to be associated with forming the cooling tower concrete foundation structure. The cooling tower (Letter of Understanding [LOU] 46) was investigated as part of the Phase B investigation by 11 borings to depths of approximately 40 feet bgs. Select samples were analyzed for perchlorate, metals, hexavalent chromium, radionuclides, total petroleum hydrocarbons, dioxin/furans, and asbestos. No samples exceeded their respective basic comparison levels (BCLs). Phase B investigation results are presented in Table 2.

During tailings removal, a shallow inactive vitreous clay pipe, historically used for transport of non-contact cooling water, was disturbed. Approximately 5 to 10 gallons per minute (gpm) of water was discharged to the ground surface for approximately 24 hours before Tronox was able to close a valve. The pipe breakage and subsequent discharge was reported to NDEP by Tronox via e-mail on July 12, 2010. Tronox indicated in the e-

mail that the source of the water was stabilized Lake Mead water. The water was sampled and tested and was found to have a pH of 6.62, a conductivity of 3,340 $\mu\text{mho}/\text{cm}$, and barium and mercury at concentrations of 0.22 mg/L and 0.02 mg/L, respectively. No other metals were detected.

Confirmation Soil Sampling

Confirmation soil sampling will be conducted following procedures set forth in Northgate's *Pre-Confirmation Sampling Work Plan*¹ and the BMI standard operating procedures (SOPs)². The objectives of the sampling program are: 1) to confirm that Mn tailings are removed and that associated chemicals (manganese, cobalt and arsenic) are below the following screening levels. NDEP's BCLs for manganese and cobalt are 13,700 and 331 milligrams per kilogram (mg/kg), respectively, and the background concentration for arsenic is 7.2 mg/kg; and, 2) to additionally analyze select shallow soil samples for dioxin/furans based on previous Phase B soil boring SA52, where a 890 parts per trillion dioxin concentration was detected.

Soil samples will be collected using a slide-hammer sampler from 21 locations at a depth of 0-6 inches below ground surface (bgs), as shown on Figure 1. Additional samples will be collected from 6-12 inches bgs at each sampling location; these samples will be placed on hold pending receipt of analytical results of the shallow samples. Nine of the sample locations will be placed in a grid pattern across the main portion of the Mn tailings area; four will be located along the eastern property boundary; two will be located along the west boundary of the tailings area; four will be located along the north boundary of the tailings area; and two will be located in the vicinity of boring SA139 (northeast corner). No samples will be collected along the southern boundary, as this area is a part of active Site operations and there is an active utility corridor present. The proposed sampling locations and analyses are presented in Table 1.

Results of confirmation soil sampling will be presented in the Human Health Risk Assessment and Closure report for RZ-C.

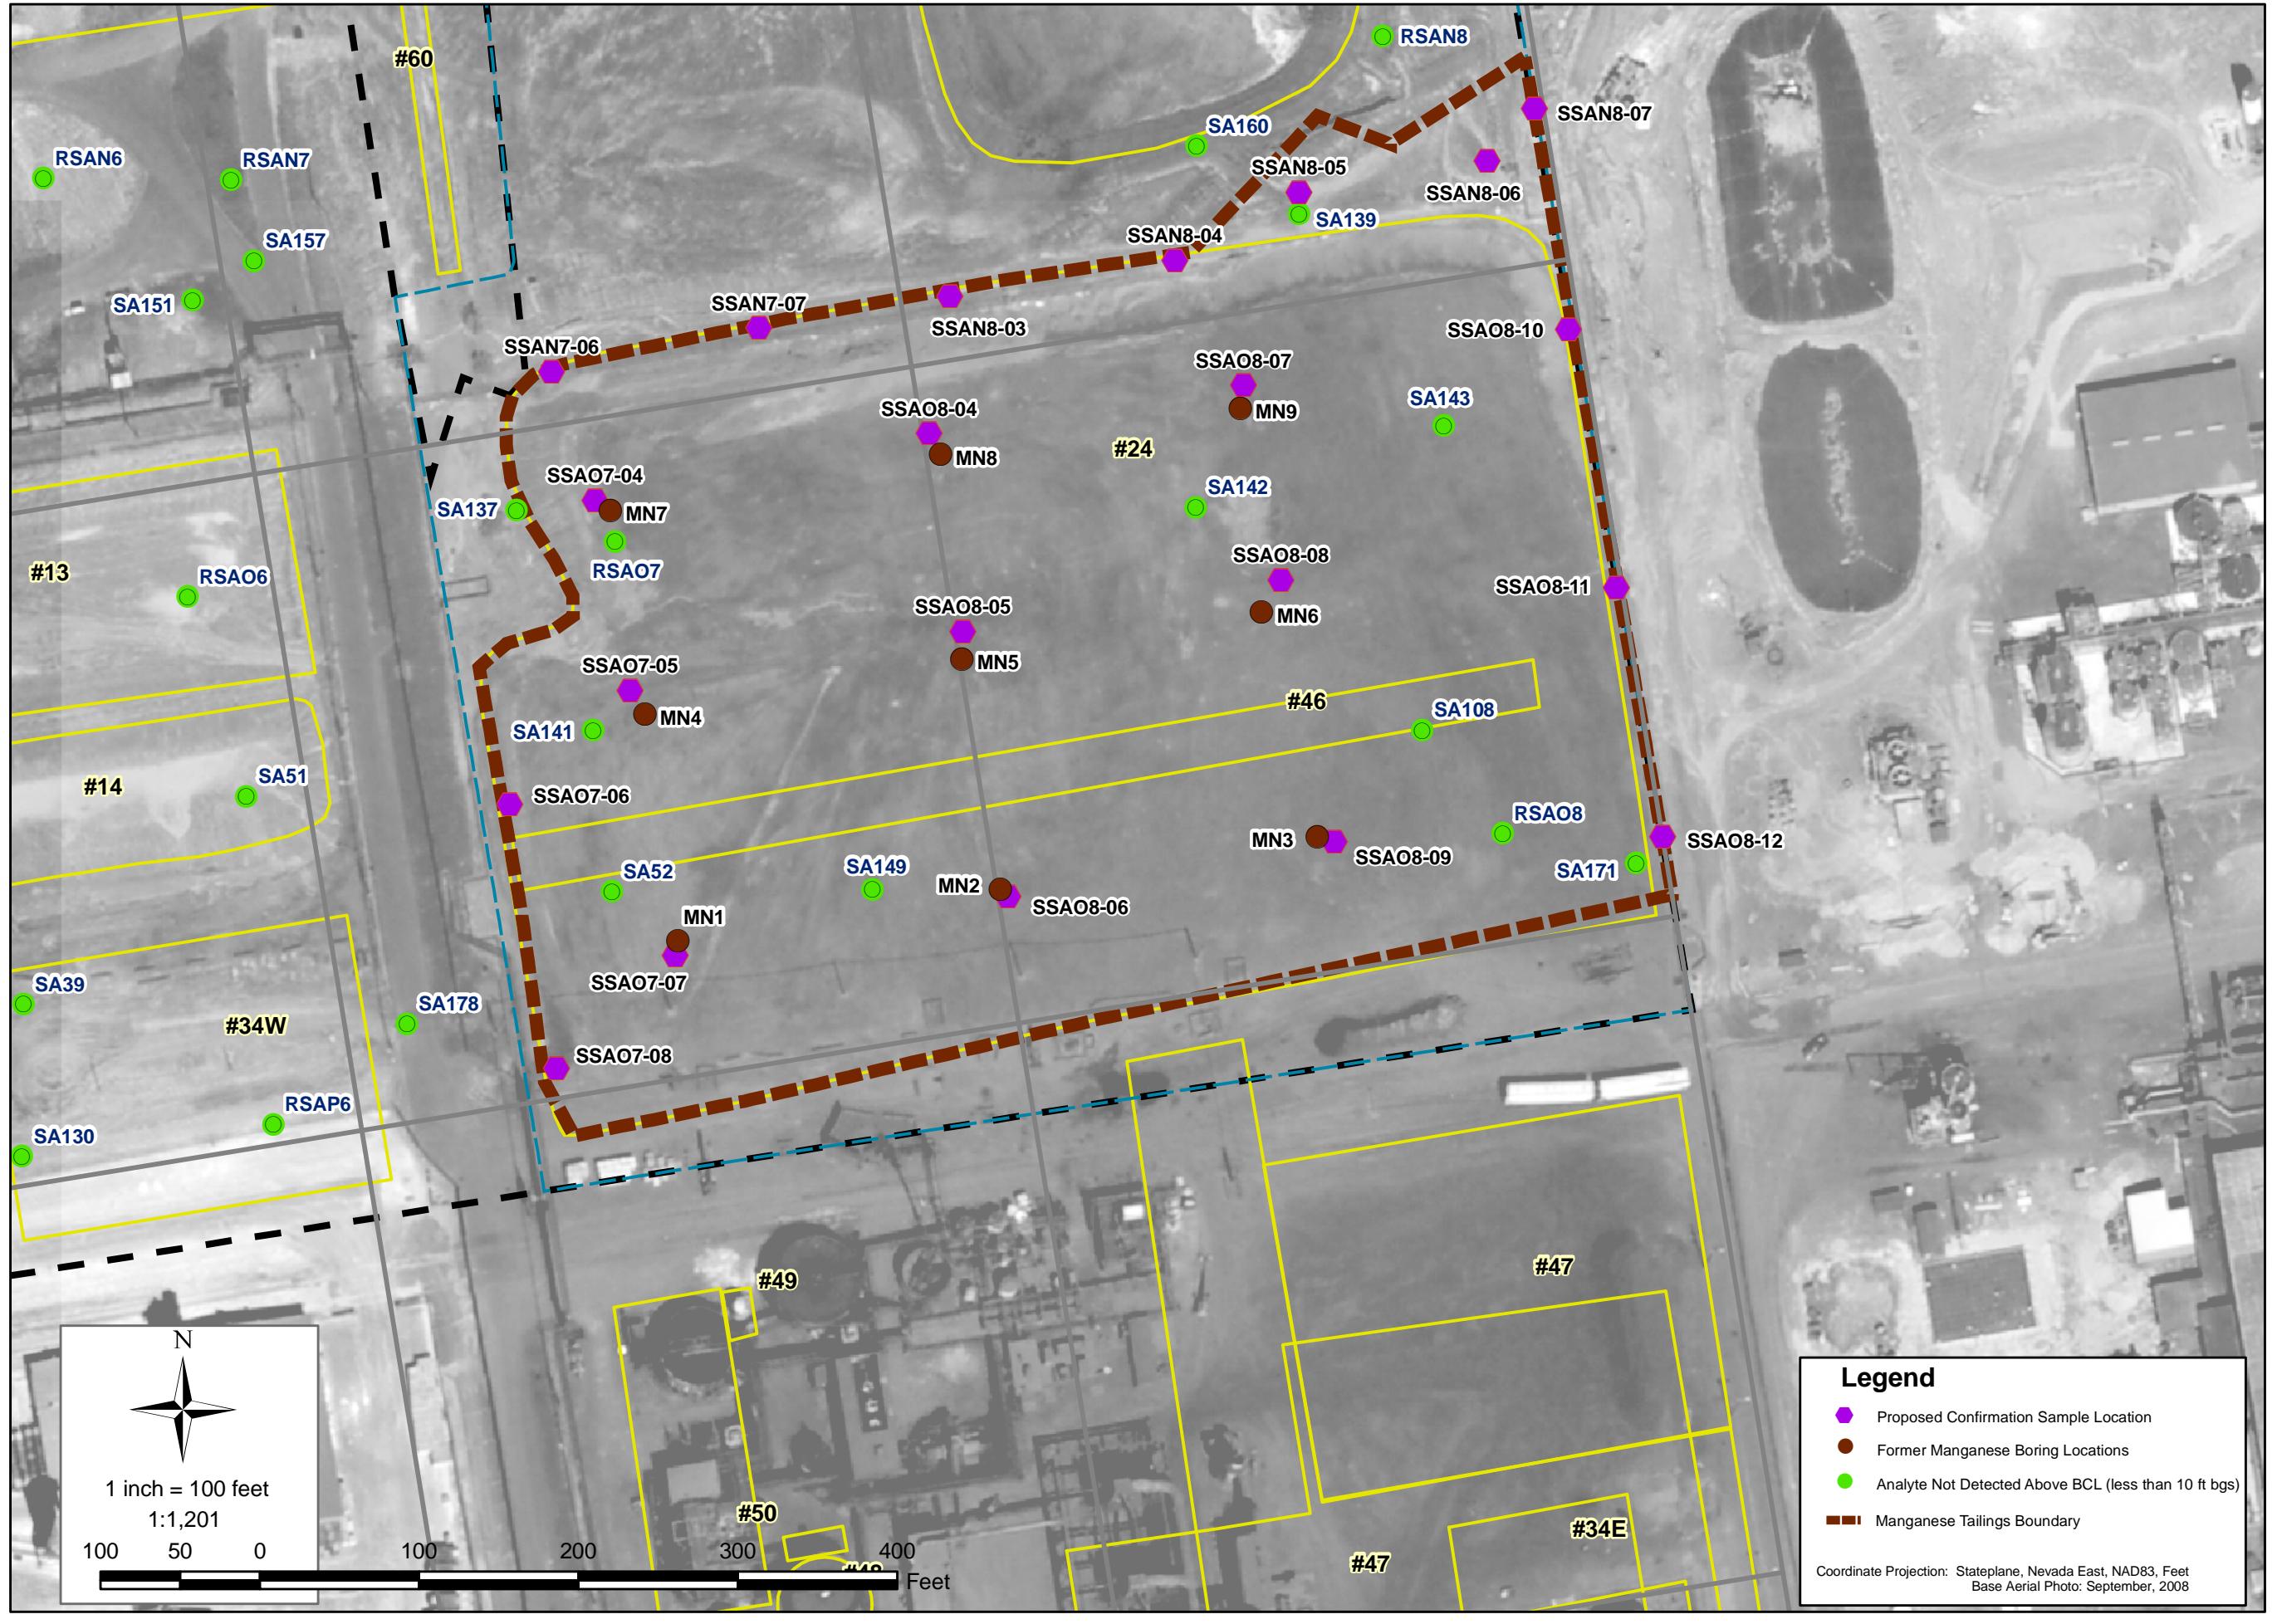

If you have any questions about this sampling program, please contact us.

ENSR Project: 04020-023-420

Subject: Volume Determination of Manganese Tailings Pile, Tronox Facility, Henderson, Nevada.

Dear Ms. Crowley:

At your direction, ENSR drilled and sampled nine soil borings in the manganese tailings (Mn tailings) pile on the Tronox LLC (TRX) facility in Henderson, Nevada. The scope of work also included estimating the in-place volume of the Mn tailings. Field work was conducted on September 13 and 14, 2006, under the Master Services Agreement OKC MWA C-1488-11 between TRX Corporation and ENSR, and as described in the ENSR proposal dated August 23, 2006. Mr. Edward J. Krish was mobilized as the project supervising geologist and Mr. Eric Nelson as the staff geologist. Mr. David Gerry was the Nevada Certified Environmental Manager directing the activities.

Task 1: Drill and Sample Nine Soil Borings

According to existing maps and aerial photographs provided by Tronox, the Mn tailings pile is estimated to encompass an area of approximately eight-acres. ENSR contracted with WDC Exploration & Wells in Las Vegas, Nevada, to drill nine borings on the Mn tailings pile. The borings were laid out as a grid of three borings on three parallel traverses. Borings were drilled through the Mn tailings pile and terminated in the underlying native soil at depths ranging between 10 feet below ground surface (bgs) and 31 feet bgs. In general, the Mn tailings are composed of various combinations of dark gray to dark brown silty clay, silty sand and sandy clay with minor amounts of fine gravel. The underlying alluvium consists of light brown silty sand and silty gravelly sand. A total of 180 feet were drilled between the nine boring locations.

The borings were drilled using a hollow-stem auger. Split-spoon and bulk soil samples were collected approximately every ten feet, or from the approximate top, middle, and bottom of the pile. Additional split-spoon soil samples were collected, as needed, to confirm the location of the interface between the overlying Mn tails and the underlying native soil. The split-spoon and bulk samples are archived at the Tronox Henderson facility. The boring locations were surveyed using a high resolution GPS and are shown on **Plate 1**, the Manganese Tailings Reserve Map. Lithologic descriptions of the Mn tailings material were recorded for the nine borings (**Appendix A**). The soil boring drilling statistics and soil samples collected during this drilling activity are listed in **Table 1**. Three bulk samples of approximately 15 pounds each, MN-

1-1-5, MN-6-10-15, and MN-9-25-30, were shipped to McClelland Labs in Sparks, Nevada on behalf of AIG for Profile 1 testing per the Meteoric Water Mobility Procedure.

Task 2: Calculation of the Volume of the Manganese Tailings Pile

A search of the old Basic Magnesium, Inc. drawings collection yielded the pre-tails 1944 as-built drawings of the area. **Plate 2**, the Pre-Tailings Surface Configuration Map, shows the locations of the old cooling tower, roads, railroad grades, berms, and basins with spot elevations. These data, combined with the current topographic map of the Mn tailings pile, **Plate 1**, and the base elevations of the tailings from the drill holes, were used to construct the three cross sections of the Mn tailings pile (**Figures 1, 2, and 3**).

To calculate the volume of the Mn tailings pile, a cross-sectional block model technique was used. The pile was subdivided into three blocks as shown on **Plates 1 and 2**, each with a width extending half way between the adjacent drill hole and/or the edge of the pile.

The area of Mn tails in each cross section was measured and extrapolated across the width of the block to arrive at the cubic feet of tailings in each block. These cubic feet values were converted to cubic yards and summed to arrive at the total cubic yards of tailings in the pile. The calculation for each block is shown on its' respective figure. The results show that approximately 40,023 cubic yards of tails are in Block A, approximately 67,453 cubic yards are in Block B and approximately 105,555 cubic yards are in Block C, for a grand total of approximately 213,031 cubic yards of Mn tailings in the pile.

If you have any questions or concerns please contact me at 405-760-5777 or ekrish@frontiernet.net.

Sincerely,

David L. Gerry, R.G., C.E.G.
Senior Program Manager

Ed Krish
Supervising Geologist

RE: Response to Nevada Division of Environmental Protection's July 20, 2010
Comments on TRX Letter Submittal RE: Manganese Tailings Pile Confirmation Sampling, dated July 9, 2010

Response to Comments

Northgate Environmental Management, Inc. (Northgate) submits this Response to Comments on the *TRX Letter Submittal RE: Manganese Tailings Pile Confirmation Sampling* on behalf of Tronox LLC (Northgate, July 9, 2010). Tronox has reviewed the following Nevada Division of Environmental Protection (NDEP) comments and has revised the submittal accordingly.

1. *TRX should provide a brief background section discussing a CSM-based description of the manganese tailings pile area including history and a list of wastes and potential contaminants that were placed or occurred in this area. Please note that the liquids discovered during the excavation should be discussed for potential impact and targeted sampling.*

Response: This revised document includes background information regarding the history of the manganese (Mn) tailings pile.

2. *During the Phase B Source Area Investigation, TRX collected samples from the surface (0.0-0.5 fbgs), 5 fbgs, and 10 fbgs; however, TRX is only proposing to sample at the surface and 0.5-1.0 fbgs interval. TRX should conduct the sampling of this area in a manner consistent with previous sampling that will be used in a Health Risk Assessment for this Remediation Zone.*

Response: As discussed in the July 23, 2010 NDEP-Tronox-Northgate Conference Call, eight borings were previously advanced in the Mn tailings area as part of the Phase B investigation, and deeper soil samples were collected from below the interface between the Mn tailings and native soil that characterize the soil as clean. These clean boring locations are shown on Figure 1. Soil samples collected from these borings were analyzed for the Phase B suite of analyses; therefore, analyzing the Mn tailings confirmation samples would be repetitious. The shallow surface samples proposed are to confirm that Mn tailings were successfully removed.

3. *TRX should justify the elimination of chemical analytical suites from the Phase B broad suite analysis using CSM-based discussion. All chemical suites used in Phase B should be sampled unless otherwise approved by the NDEP.*

Response: Please see Response to Comment 2.

4. *TRX should acknowledge and discuss the former cooling tower that is located in the manganese tailings area and how this area will be characterized.*

Response: The cooling tower (LOU 46) was investigated as part of the Phase B investigation with eleven borings to depths of approximately 40 feet below ground surface. Select samples were analyzed for perchlorate, metals, hexavalent chromium, radionuclides, total petroleum hydrocarbons, dioxin/furans, and asbestos in accordance with the NDEP-approved Phase B sampling and analysis plans.

5. *TRX should also propose sampling on the southern boundary of the manganese tailings area.*

Response: The southern boundary is an area of active operations. There is an active utility corridor that runs along this boundary precluding drilling. The area will be addressed in the future when operations cease and the utilities are no longer active. It should be noted that Phase B borings in the Mn tailings area indicate that soils are below basic comparison levels.

6. *Figure 1, NDEP provides the following comments:*

- a. *Please clarify what the Manganese Boring Locations are and if samples were collected, please present the results.*
- b. *Please provide the Phase B results in this Figure.*

Response:

- a. MN-1 through MN-9 were borings advanced through the Mn tailings for waste profiling characteristics. The borings were not advanced into soil. The Mn tailings characterization report is included as Attachment A.
- b. Figure 1 has been revised to show the Phase B sampling locations. Results from the Phase B sampling are presented in Table 2.
