

TECHNICAL MEMORANDUM

To: Nevada Environmental Response Trust

Cc: Nevada Division of Environmental Protection
United States Environmental Protection Agency

From: Dana Grady

Date: April 26, 2021

Subject: Seep Well Field Area Bioremediation Treatability Study Quarterly Progress Report

At the direction of the Nevada Environmental Response Trust (NERT or Trust), Tetra Tech, Inc. (Tetra Tech) has prepared this memorandum which summarizes Tetra Tech's progress from January through March 2021 toward successfully implementing the Seep Well Field (SWF) Area Bioremediation Treatability Study.

Task Progress Update: January 2021 – March 2021

Task M11 – Seep Well Field Area Bioremediation Treatability Study (SWFTS)

- Task Leader – Dana Grady
- Current Status
 - As presented in Treatability/Pilot Study Modification No. 6, the ongoing efforts related to the SWF Area Bioremediation Treatability Study focus on refinement of operations and maintenance techniques (O&M) associated with long-term implementation of in situ bioremediation (ISB) in the vicinity of the SWF and Las Vegas Wash. For reference, Figure 1 provides a map of the injection and monitoring well locations. Well construction details and a summary of the groundwater analytical results for perchlorate, chlorate, nitrate, total organic carbon (TOC), and dissolved oxygen through February 2021 are provided in Tables 1 and 2, respectively.
 - O&M of SWF Area Bioremediation Treatability Study:
 - Maintenance Activities – As part of continued evaluation of maintenance activities associated with in-situ bioremediation systems, a small-scale maintenance event was performed from February 16, 2021 to February 19, 2021 prior to the seventh injection event. This field effort included performing maintenance on four injection wells as follows:
 - SWFTS-IW06B – Hydrojetting;
 - SWFTS-IW13B – Hydrojetting with chemical addition;
 - SWFTS-IW15 – Surge and bail; and
 - SWFTS-IW19 – Hydrojetting with chemical addition.

As described further below, injection well performance during the seventh injection event demonstrates that targeted well maintenance of select injection wells can successfully restore or maintain performance of the injection well transect long term. This is a significant finding for long-term operations of ISB at the NERT facility.

- *Injection Activities* – Mobilization and set-up activities associated with the seventh injection event began on February 22, 2021. Injections were performed from February 24 to March 16, 2021. The seventh injection event was conducted via batch mixing in accordance with the NDEP-approved Field Guidance Document for Batch Mixing and Injection. Details of the seventh injection event, including a summary of injection rates, pressures, quantities, and specific gravity information, are included in Tables 3 through 7 as attachments to this quarterly progress report. Additionally, a photo log showing the injection process to document site activities is provided as Attachment 1 to this quarterly progress report. Noteworthy items from the seventh injection event are as follows:
 - All twenty-five injection wells received their complete targeted quantities of injectate solution and follow-up distribution water at injection pressures less than the maximum permissible injection pressure of 35 psi.
 - All four of the injection wells that received well maintenance during the February 2021 event (i.e., SWFTS-IW06B, SWFTS-IW13B, SWFTS-IW15, and SWFTS-IW19) observed lower pressures and/or higher injection rates during the recent seventh injection event compared to the previous sixth injection event, which indicates that recent maintenance activities resulted in improved injectability.
- Performance of the SWF Area Bioremediation Treatability Study
 - To date, this treatability study continues to demonstrate that ISB is an effective technology to degrade perchlorate and chlorate in groundwater within the alluvium. As expected, the interval between carbon donor injections has increased over time. Groundwater perchlorate concentration reductions compared to baseline continue to be observed approximately eight months following injections. Although concentrations are still reduced, the results from the recent sampling events indicate a slight increase in groundwater perchlorate concentrations, which is a signal for the need of a future injection event. Following the recent February/March 2021 injection event, a groundwater sampling event was also performed during the end of this quarter from March 29, 2021 through April 2, 2021. These results will be presented in the next quarterly progress report once data has been received. The effectiveness of the injections will continue to be evaluated throughout the study extension to arrive at an approximate injection frequency required for ISB-related activities in the alluvium at the NERT site. Results of the December 2020 and February 2021 groundwater sampling events (approximately six and eight months after the sixth injection event) are summarized below:
 - Groundwater samples collected from the four monitoring wells located between the injection well transects observed an average decrease in perchlorate concentrations of greater than 75% in the December 2020 and February 2021 sampling events when compared to baseline. Noteworthy findings are described below:
 - Groundwater samples collected from monitoring well SWFTS-MW14 indicated that perchlorate concentrations were not detected above the method detection limit during the sampling event performed following the sixth injection event. Perchlorate concentrations in groundwater samples collected from monitoring well SWFTS-MW14 began slightly increasing in

October 2020 and continued this increasing trend during the December 2020 and February 2021 sampling events, with perchlorate detected at 2,900 and 3,300 µg/L, respectively. These results still represent an 86% reduction when compared to baseline concentrations. It is likely that these concentration increases signal the need for the next injection event.

Additionally, perchlorate fluctuations and increases in groundwater samples collected from this monitoring well will continue to be evaluated with respect to the variations of O&M components (i.e., changes to the mixing process and/or limited injectate accepted into nearby injection well SWFTS-IW13B during the sixth injection performed in May/June 2020). As previously noted in the O&M discussion herein, routine maintenance was performed in February 2021 nearby injection well SWFTS-IW13B, which resulted in the injection well accepting the full targeted injectate quantity during the seventh injection event.

- As presented in the previous quarterly progress reports, groundwater samples collected from SWFTS-MW15 indicated the lowest perchlorate concentrations to date at this monitoring well following the sixth injection event. Perchlorate concentrations in the groundwater samples collected from SWFTS-MW15 during the December 2020 and February 2021 sampling events continued to indicate concentration decreases of approximately 50% or greater when compared to baseline. However, as mentioned in the discussion for SWFTS-MW14, recent increases likely signal the need for the next injection event.
- Although perchlorate concentration reductions remain greater than 60% at SWFTS-MW02, groundwater samples collected from this monitoring well began showing increases in perchlorate concentrations following the fifth injection event. During 2020 (as noted in previous quarterly progress reports), perchlorate concentrations have significantly increased in groundwater samples collected from monitoring well SWFTS-MW04, which is located generally upgradient of SWFTS-MW02. Even though groundwater perchlorate concentrations have decreased in samples collected from this upgradient monitoring well during this quarter, these trends are likely a result of contaminated groundwater from the western portion of the study area from which groundwater migrates into the study area without passing through the treatment zone.
- Perchlorate concentrations in groundwater samples collected from the 16 downgradient monitoring wells also continue to show an average of 52% reduction in concentrations when comparing the results from the December 2020 and February 2021 sampling events to baseline. Noteworthy findings are described below:
 - Groundwater samples collected from 15 of the 16 downgradient monitoring wells indicated perchlorate concentration reductions when compared to baseline concentrations, with groundwater samples from nine monitoring wells indicating perchlorate concentration reductions ranging from 50% to 100%.
 - Perchlorate concentrations in groundwater samples collected from downgradient monitoring wells PC-91 and SWFTS-MW20 continued to observe strongly decreasing trends, with perchlorate concentrations in

groundwater samples collected from PC-91 below method detection limits and 50 µg/L in the December 2020 and February 2021 sampling events, respectively. Additionally, the perchlorate concentration in groundwater collected from SWFTS-MW20 was 79 µg/L in February 2021, which is the lowest to date since injections began.

- Chlorate concentrations in groundwater follow trends similar to perchlorate, with greater than 70% reduction in chlorate concentrations in groundwater samples collected from 12 monitoring wells (located both between the injection well transects and downgradient) during the December 2020 sampling event and 13 monitoring wells in the February 2021 sampling event when compared to baseline. Chlorate concentrations in groundwater were less than 100 µg/L at nine monitoring wells during the December 2020 and February 2021 sampling events.
 - Nitrate concentrations in groundwater were also evaluated since it is often a competing electron acceptor and carbon substrate consumer. Nitrate concentrations in groundwater were generally greater than 10 milligrams per liter (mg/L) during the baseline sampling event. During the December 2020 and February 2021 sampling events, groundwater samples collected from seven downgradient monitoring wells exhibit nitrate concentrations of less than 5 mg/L, which represents a concentration reduction of at least 50% or greater compared to baseline.
 - As previously noted in recent quarterly reports, groundwater perchlorate concentrations in upgradient well SWFTS-MW12 continue to remain near or below sample detection limits. This well is located approximately 150 feet upgradient of the injection wells and is the well from which most of the distribution water was extracted during the fifth injection event. During the sixth and seventh injection events in May/June 2020 and February/March 2021, respectively, the volume extracted from SWFTS-MW12 was decreased from previous injection events to potentially reduce the effect of groundwater extraction during injections on concentrations at SWFTS-MW12. As a result, it is expected that over time, perchlorate concentrations will gradually return to baseline levels at this upgradient location.
- Schedule and Progress Updates
 - This task remains on schedule.
 - The 2020 Annual Progress Report will be submitted during the second quarter of 2021.
 - The next groundwater sampling event is scheduled for the week of June 1, 2021.
 - The exact timing of the next injection event will be determined using the results from the on-going effectiveness monitoring program. Based on injection frequency to date, the next injection event will likely occur during the fourth quarter of 2021.
 - Health and Safety
 - There were no safety incidents related to Task M11 during the reporting period January through March 2021.

CERTIFICATION

Seep Well Field Area Bioremediation Treatability Study Quarterly Progress Report

Notes:

amsl - above mean sea level

bTOC - below top of casing

bgs - below ground surface

UMCf - Upper Muddy Creek Formation

1. Baseline depth to water measurements were collected in July 2017.

Notes:

mg/L - milligrams per liter

µg/L - micrograms per liter

-- not analyzed

< The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.

J The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

J+ The result is an estimated quantity, but the result may be biased high.

J- The result is an estimated quantity, but the result may be biased low.

UJ The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

E Instrument error during sampling

Daily Summary							0	8,005
3/16/2021	SWFTS-IW17	9:00 AM	10:00 AM	60	0.2	0	0	10.0
Daily Summary							0	10
Injection Event Summary							85,386	341,694

Notes:

gpm - gallons per minute

min - minutes

gal - gallons

psi - pounds per square inch

¹Injection duration indicates the total minutes of active injection per day, accounting for any downtime in injections that may have occurred throughout the day. Therefore, injection duration may be less than the difference in daily injection start and stop times indicated.

²Sustained pressure reported represents the highest pressure recorded during the injection interval indicated.

Notes:

Dup - sample duplicate

NM - Not measured

SD - standard deviation

1. Injectate solution includes emulsified vegetable oil (EOS_{PRO}), phosphate solution (Aquapure 3601 NSF), glycerin, and sodium sulfite mixed into extracted groundwater. A 1:4 injectate stock solution standard was prepared for each mixture of deliveries of EOS_{PRO} used for batch mixing.

5A	2/27/2021	12:38	14551	0.995	72	0.996	11.7%	YES	Pre-injection.
5A	2/27/2021	13:59	8502	0.996	73	0.997	10.8%	YES	
5A	2/27/2021	15:07	2962	0.996	74	0.997	10.8%	YES	
6B	2/28/2021	9:05	14619	0.995	63	0.995	13.2%	YES	Pre-injection.
6B	2/28/2021	10:27	11331	0.994	66	0.995	13.8%	YES	
6B	2/28/2021	12:30	5850	0.994	70	0.995	13.5%	YES	

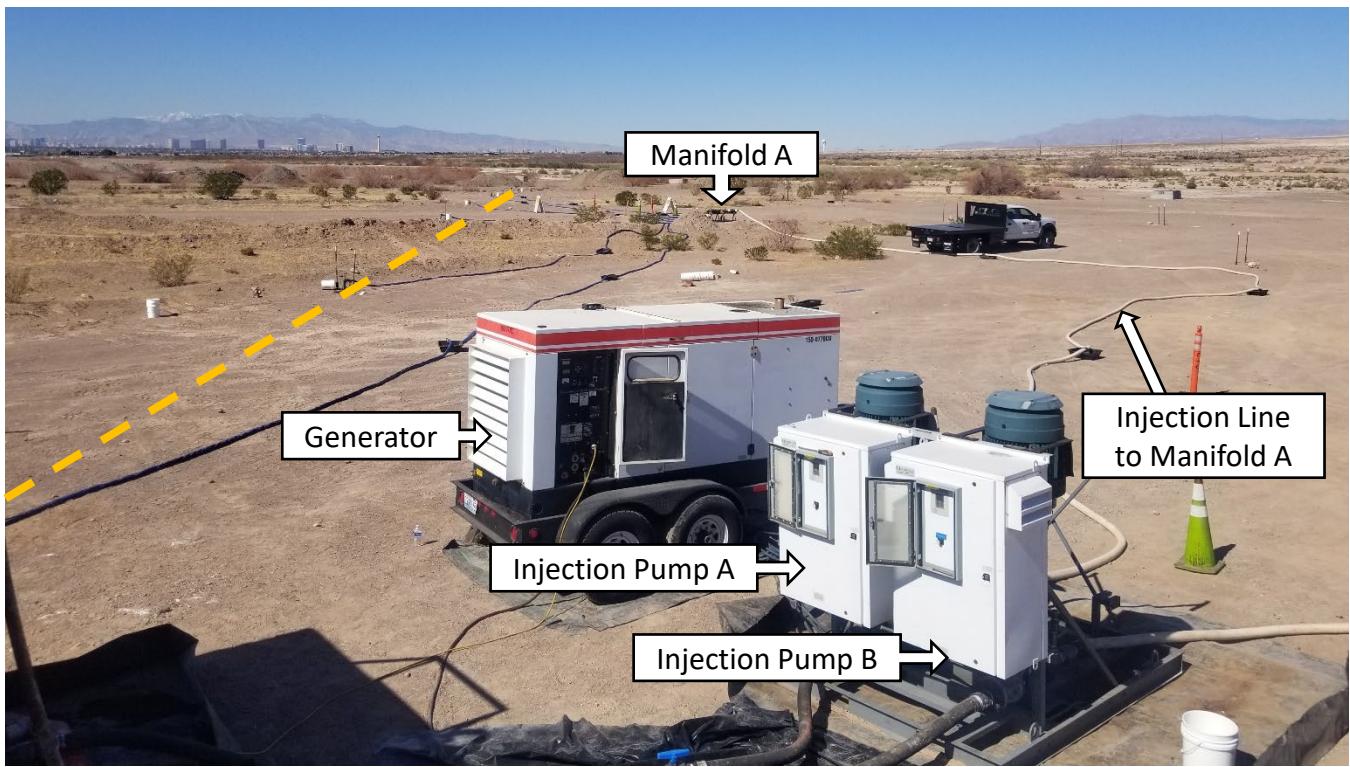

1. The acceptable range of specific gravity measurements was determined to be 0.991 to 1.001 for EOS_{PRO} Deliveries 1 through 3, and 0.990 to 1.000 for batches mixed after EOS_{PRO} Delivery 4. This was determined by taking +/- 10% of the difference between the pure EOS_{PRO} with amendments solution and the pure extracted groundwater (equivalent to 0.005) and then adding and subtracting that value with the specific gravity of the 1:4 standard (shown in Table 5).

2. Tank level approximated based on sample collection time and average injection rates.
