From: Dana Grady

Date: June 30, 2021

Subject: Las Vegas Wash Bioremediation Pilot Study Monthly Progress Report

At the direction of the Nevada Environmental Response Trust (NERT or Trust), Tetra Tech, Inc. (Tetra Tech) has prepared this memorandum which summarizes Tetra Tech's progress during May 2021 toward successfully implementing the Las Vegas Wash Bioremediation Pilot Study.

Task Progress Update: May 2021

Task M19 – Las Vegas Wash Pilot Study

- Current Status
 - *Injections* – The first injection event was completed in December 2020 and included injections into all three pilot study zones (Zone 1, 2, and 3) within the alluvium and/or Upper Muddy Creek formation (UMCf). A summary of the first injection event was provided in the January 2021 monthly progress report. The second injection event was performed from April 12, 2021 to April 21, 2021 and included injections into only the Zone 2 alluvium. Due to slower groundwater flow rates in the UMCf, the next round of injections into Zones 1, 2, and 3 UMCf will likely not occur until fourth quarter 2021. During the second injection event into the Zone 2 alluvium, all injection wells accepted the targeted design quantity of carbon substrate solution and follow-up distribution water. A layout map and construction details of all injection, monitoring, and extraction wells are provided on Figures 1 through 4 and Table 1. A photographic log and details of the second injection event, including a summary of injection rates, pressures, quantities, and specific gravity information were included in the April 2021 monthly progress report.
 - *Effectiveness Monitoring* – Baseline groundwater sampling was completed in the fall of 2020 prior to the first injection event. The monitoring program described in the NDEP-approved Las Vegas Wash Bioremediation Pilot Study Work Plan Addendum (referred to as Work Plan Addendum) was subsequently implemented to evaluate the effectiveness of in-situ bioremediation. As part of this monitoring program, groundwater sampling was conducted on a biweekly basis for the Zone 2 alluvium for the first two months post-injection and was followed by a monthly sampling program thereafter, which is ongoing. Groundwater sampling for the UMCf and UMCf-coarse

grained (UMCf-cg) in Zones 1, 2, and 3 has been conducted monthly over the first four months following the first injection event. In accordance with the Work Plan Addendum, groundwater sampling frequencies in the UMCf and UMCf-cg were reduced to a bi-monthly basis approximately four months after the first injection event (beginning in May 2021) due to the slower groundwater flow rates present in the UMCf. Bi-monthly sampling will continue until the next injection event into the UMCf/UMCf-cg in Zones 1, 2, and 3, at which time monthly sampling will resume. Available groundwater analytical results from the baseline sampling event and subsequent effectiveness monitoring events performed from December 2020 to April 2021 (two biweekly sampling events and the first four monthly sampling events following injections) are provided on Table 2. Results from the sampling event conducted four months post-injection (April 2021) are summarized below. Groundwater analytical results from the fifth monthly groundwater sampling event recently conducted from May 4, 2021 through May 8, 2021 will be provided in future monthly progress reports as data become available.

- Zone 2 Alluvium:
 - Groundwater samples collected from cross-gradient monitoring wells LVWPS-A2-MW04A/B and LVWPS-A2-MW05A/B, which are located approximately 17 feet from each end of the Zone 2 injection well transect, continue to exhibit perchlorate concentration decreases ranging from 37 to greater than 99 percent reduction when compared to baseline concentrations. Perchlorate concentrations in groundwater samples collected from LVWPS-A2-MW05B continue to exhibit perchlorate concentrations below detection limits.
 - Groundwater samples collected from the 14 monitoring wells located approximately 50 to 100 feet downgradient of the injection well transect exhibited an overall average percentage decrease in groundwater perchlorate concentrations (compared to baseline concentrations) of 49 percent during the fourth monthly post-injection sampling event (April 2021). Groundwater samples collected from four of these 14 monitoring wells continue to exhibit perchlorate concentration reductions of greater than 90 percent when compared to baseline. Additionally, groundwater samples collected from LVWPS-A2-MW09A/B exhibited the lowest perchlorate concentrations measured to date four months after injections.
 - Groundwater samples collected four months after injection activities from monitoring wells LVWPS-MW208B and LVWPS-MW223B, which are located approximately 200-250 feet downgradient from the injection well transect, exhibited perchlorate concentration decreases of 84 percent and 55 percent, respectively, when compared to baseline concentrations.
 - Although significant decreases in perchlorate concentrations relative to baseline conditions were still observed in April 2021, groundwater samples collected from several monitoring wells located 50 to 250 feet downgradient of the injection well transect exhibited slight increases in perchlorate concentrations during the fourth monthly sampling event. These perchlorate concentration trends helped refine the timing of the second injection event into the Zone 2 alluvium, which was performed in April 2021.
 - Chlorate results followed a similar pattern to perchlorate results for samples collected four months post-injection. Groundwater samples collected from two of the four cross-gradient monitoring wells continued to show decreases in chlorate concentrations of greater than 75 percent compared to baseline. Groundwater samples collected from four of the 18 monitoring wells located between 50 and

250 feet downgradient from the injection well transect exhibited reductions in chlorate concentration of greater than 95 percent. As previously described for perchlorate concentration trends in April 2021, groundwater samples collected from nine monitoring wells located 50 to 250 feet downgradient exhibited slight increasing chlorate concentrations during the fourth monthly sampling event. These chlorate concentrations helped refine the timing of the second injection event for the Zone 2 alluvium, which was performed in April 2021.

- Nitrate concentrations in groundwater were also evaluated because it is often a competing and preferred electron acceptor and carbon substrate consumer. Nitrate concentrations in groundwater samples collected from Zone 2 alluvium monitoring wells averaged 17 milligrams per liter (mg/L) during the baseline sampling event. Groundwater samples collected from cross-gradient and downgradient monitoring wells during the fourth monthly sampling event indicate nitrate concentrations were reduced by an average of 44 percent compared to baseline conditions. During the fourth monthly sampling event, groundwater samples collected from 11 cross-gradient or downgradient monitoring wells exhibited nitrate concentrations of less than 10 mg/L. Groundwater samples collected from five of these 14 monitoring wells exhibited nitrate concentrations less than 1 mg/L. Similar to perchlorate and chlorate, slightly increasing nitrate concentrations were observed at several cross-gradient and downgradient monitoring wells during the April 2021 sampling event. These increasing nitrate concentrations combined with slightly increasing perchlorate and chlorate concentrations at select locations supported the timing of the second injection event for the Zone 2 alluvium, which was performed in April 2021.
- Zone 1, 2, and 3 UMCf/UMCf-cg:
 - Zone 1 UMCf – Approximately four months following injections into Zone 1 UMCf, groundwater samples collected from monitoring wells LVWPS-U1-MW08A/B, which are located approximately 25 feet downgradient from the injection well transect, indicated decreases in perchlorate concentrations of 93 and 75 percent when compared to baseline concentrations, respectively. Other notable observations include groundwater samples collected from one monitoring well located 100 feet downgradient from the injection well transect (LVWPS-U1-MW09B), where perchlorate concentrations indicated a reduction of 52 percent compared to baseline conditions four months after the injection event. This is the lowest concentration detected to date at LVWPS-U1-MW09B. Nitrate and chlorate concentrations followed a similar pattern to perchlorate.
 - Zone 2 UMCf – Approximately four months following injections into Zone 2 UMCf, groundwater samples collected from cross-gradient monitoring wells LVWPS-U2-MW04 and LVWPS-U2-MW05, which are screened in the UMCf and located approximately 12 feet from each end of the Zone 2 injection well transect, continue to indicate perchlorate concentrations less than the sample detection limit in both monitoring wells. Additionally, groundwater samples collected from four of the five monitoring wells located 25 to 50 feet downgradient from the injection well transect exhibited perchlorate concentration decreases of up to 43 percent when compared to baseline concentrations. Lastly, groundwater samples collected from monitoring well LVWPS-MW223C, which is located approximately 200 feet downgradient from the Zone 2 injection well transect, indicate a perchlorate concentration reduction of approximately 51 percent when compared

- to baseline, likely indicative of a preferential flow path in this vicinity. Nitrate and chlorate concentrations followed a similar pattern to perchlorate.
- Zone 3 UMCf-cg – Approximately four months following injections into Zone 3 UMCf-cg, groundwater samples collected from three of the six monitoring wells located approximately 25 feet downgradient exhibited a greater than 92 percent reduction in perchlorate concentrations compared to baseline. In addition, groundwater samples collected from monitoring wells LVWPS-U3-MW10A/B, which are located approximately 100 feet downgradient from the Zone 3 injection well transect, both exhibited a greater than 99% reduction in perchlorate, chlorate, and nitrate concentrations compared to baseline. Lastly, groundwater samples collected from LVWPS-U2-MW12B, which is located approximately 150 feet downgradient, continued to indicate decreasing perchlorate, chlorate, and nitrate concentrations four months after injections, with concentration decreases of greater than 99 percent for perchlorate and greater than 76 percent for chlorate and nitrate when compared to baseline conditions. These observations farther downgradient relative to observations in the UMCf in Zones 1 and 2 are likely related to the coarser-grained aquifer matrix in Zone 3 UMCf-cg and faulting in the area.
 - Surface water sampling was performed prior to injection activities on October 16, 2020 and October 29, 2020. Six surface water sampling events have since been performed on a monthly basis since December 2020 (during injections) and continuing through May 2021 (after injections). Although limited surface water sampling will be periodically conducted downgradient from the study area, reducing perchlorate concentrations in surface water is not an objective of this pilot study. Noteworthy surface water results related to the pilot study will be summarized in future monthly progress reports as warranted.
 - Dye Study – As part of injection activities, rhodamine WT and fluorescein tracer dyes were injected into the alluvium and UMCf/UMCf-cg, respectively. A summary of the sampling program and results from the December 2020 and January 2021 sampling events was presented to NDEP on March 4, 2021. Available analytical results for dye samples collected during baseline activities, injection activities, and the December 2020 through April 2021 effectiveness monitoring events are provided on Table 3. There were several cases where charcoal samplers showed low detections of dye, but the water samples did not show dye, indicating that either the dye peak already passed before the water sample was collected, or the levels of dye in the water were too low to be detectable. Results from future sampling events will be evaluated to provide additional clarification of the likely scenario. Noteworthy results during this monitoring period (April 2021 sampling event) are described below:
 - Zone 2 Alluvium:
 - During injection activities, rhodamine tracer dye was detected in all four of the Zone 2 alluvium dose response wells. Four months following injection activities, rhodamine tracer dye was still being detected in either charcoal or water samples from all four dose response wells.
 - Cross-gradient monitoring wells LVWPS-A2-MW04A/B and LVWPS-A2-MW05A/B (located approximately 17 feet from the two end of the Zone 2 injection well transect) had detections of rhodamine dye with the field probe in all four of these wells during injections. Four months following injections, rhodamine dye was detected in groundwater samples collected from two monitoring wells LVWPS-A2-MW05A/B. However, total organic carbon (TOC) concentrations (a

surrogate for the carbon substrate injected) remain elevated above baseline concentrations in all four cross-gradient wells. This is expected based on the ability of the emulsified vegetable oil to adsorb to the subsurface in the vicinity of the injection well transect, whereas the tracer dye continues to move downgradient.

- As expected, the high groundwater flow velocity in the alluvium resulted in many downgradient wells observing the presence of dye during active injections or within a few days after injections were completed. Approximately four months after injection activities were completed, rhodamine dye was detected in Zone 2 alluvium groundwater samples collected from five monitoring wells located 50 to 250 feet downgradient from the injection well transect. Additionally, rhodamine dye was detected in charcoal samplers collected from 11 monitoring wells located 50 to 250 feet downgradient from the injection well transect. Lastly, four months after injections, rhodamine dye continued to be detected in charcoal collected from wells LVWPS-MW209 and LVWPS-MW210A/B, which are located approximately 625 and 850 feet downgradient, respectively.
- Rhodamine concentrations are decreasing in most wells at this point, indicating that the peak has already passed, which is expected given the typically high flow velocities in the Zone 2 alluvium.
- Zone 1, 2, and 3 UMCf/UMCf-cg:
 - Zone 1 UMCf – Four months after injections were completed in Zone 1 UMCf, fluorescein tracer dye was no longer detected in groundwater samples collected 50 feet upgradient from the injection well transect at wells LVWPS-U1-MW06B and LVWPS-U1-MW07 indicating downgradient migration over time. Dye continued to be detected in charcoal or groundwater samples collected from all four dose response wells and monitoring wells LVWPS-U1-MW08A/B (located 25 feet downgradient). In addition, fluorescein dye continued to be detected in charcoal collected from monitoring well LVWPS-U1-MW02B (located approximately 33 feet downgradient) after being detected for the first time three months after the first injection event.
 - Zone 2 UMCf – Approximately four months after injections, fluorescein was detected in the groundwater sample collected from dose response well LVWPS-U2-DR02 and one cross-gradient monitoring well LVWPS-U2-MW05, which is located approximately 12 feet from the injection well transect. Rhodamine and low levels of fluorescein continued to be detected in charcoal at well LVWPS-U2-MW17, which is located 100 feet downgradient. The rhodamine detection is from the injections into the Zone 2 alluvium, which likely migrated into the downgradient UMCf well due to localized downward gradients present within Zone 2. Fluorescein was also detected in charcoal samples from six alluvial wells located 50 and 100 feet downgradient from the Zone 2 UMCf injection well transect, indicating upflux from the UMCf into the alluvium in the Zone 2 vicinity due to localized upward gradients in Zone 2. These wells (LVWPS-A2-MW08C, LVWPS-A2-MW17C, LVWPS-A2-MW14A, LVWPS-A2-MW12A/B, and LVWPS-A2-MW13B) have had fluorescein detections in charcoal beginning in December 2020 to January 2021, which continued across multiple subsequent months. Two wells (LVWPS-A2-MW08C, LVWPS-A2-MW17C) have also had detections of fluorescein in water samples.

- Zone 3 UMCf-cg – Approximately four months after injections were completed in the Zone 3 UMCf-cg, fluorescein continued to be detected in either charcoal or groundwater samples collected from all dose response wells and four of the six monitoring wells located approximately 25 feet downgradient from the Zone 3 injection well transect. In addition, fluorescein tracer dye was detected in charcoal and/or groundwater samples collected from monitoring wells LVWPS-U3-MW10A/B and LVWPS-MW12A/B, which are located approximately 100 and 150 feet downgradient, respectively.
- Access and Permitting
 - All access agreements and permits are now in place for all projected pilot study activities.
- Schedule and Progress Updates
 - The sixth monthly effectiveness monitoring event is scheduled for the week of June 7, 2021. In accordance with the Work Plan Addendum, the effectiveness monitoring program associated with Zones 1, 2, and 3 UMCf and UMCf-cg will be performed on a bimonthly basis beginning in May 2021 and continuing on a bimonthly basis until additional injections are performed in the UMCf/UMCf-cg.
 - The third injection event into all remediation zones is tentatively planned for the fourth quarter of 2021. The exact timing of the injection event will be determined based on results from the on-going effectiveness monitoring program.
 - Aquifer testing and microbial sampling is planned for the third quarter of 2021 prior to the third injection event.
- Health and Safety
 - There were no safety incidents related to Task M19 during May 2021.

Table 1
Phase 2 Well Construction Details
Las Vegas Wash Bioremediation Pilot Study

Table with 18 columns: Well ID, Screened Lithology, Northing, Easting, Ground Surface Elevation, Top of Casing Elevation, Depth to Water, Construction Type, Construction Material, Slot Size, Filter Pack Gradation, Borehole Diameter, Borehole Total Depth, Well Diameter, Nominal Screen Length, Well Total Depth, Bottom of Screen, Top of Screen. Rows include various well IDs like LVWPS-U2-IW07, LVWPS-U2-MW01, LVWPS-U3-DR01, etc.

Notes
 amsl - above mean sea level
 bgs - below ground surface
 bTOC - below top of casing
 PVC - polyvinyl chloride
 UMCf - Upper Muddy Creek formation
 UMCf-cg - Upper Muddy Creek formation - coarse grained facies
 UMCf/Horse Springs- Alternating layers of UMCf, semi-consolidated UMCf, and reworked Horse Springs formation.
 UMCf (Semi-Cons) - Semi-consolidated Upper Muddy Creek formation
 --- Not Applicable

1. Depth to water measurements collected in October 2020.
 2. Well names including IW indicate an injection well. Well names including DR indicate a dose response well. Well names including MW indicate a monitoring well. Well names including EW indicate an extraction well.

Notes:

- Not tested.
- J- The result is an estimated quantity, but the result may be biased low.
- J The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
- J+ The result is an estimated quantity, but the result may be biased high.
- < The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.
- R The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.

Notes:

- nm nanometers
- conc concentration
- ppb parts per billion
- ND No dye detected
- FD field duplicate

** A fluorescence peak is present that does not meet all the criteria for this dye. However, it has been calculated as a positive dye result. See note 2 below.

1. Dye concentrations are based upon standards used at the Ozark Underground Laboratory (OUL). The standard concentrations are based upon the as sold weight of the dye that the OUL uses - 20% by weight for rhodamine WT and 75% by weight for fluorescein.

2. Emission fluorescence peaks are a function of the dye and the liquid matrix of the sample. Narrow acceptable wavelength ranges usually used as a criterion for positive dye detections do not always apply to samples from this study due to the presence of varying concentrations of emulsified vegetable oil and an eluting solution mixed in with the samples.
