## **1.0 INTRODUCTION**

This data validation summary report (DVSR) has been prepared by Laboratory Data Consultants, Inc. (LDC) to assess the validity and usability of laboratory analytical data from the Annual Remedial Performance Sampling conducted during January to June 2020 at the Nevada Environmental Response Trust (NERT) site in Henderson, Nevada. Data collection and management was performed in accordance with the *Remedial Performance Sampling and Analysis Plan, Revision 1, Nevada Environmental Response Trust Site, Henderson, Nevada* (SAP Revision 1) dated March 2020 and included the collection and analyses of 1041 environmental and quality control (QC) samples. In addition, sample M-99-20200512 was collected and analyzed; however, this sample was determined to be taken from residual water below the well screen; results are not representative of groundwater and the well is considered “dry”. This sample was not validated; therefore, analyte counts were not included in the DVSR and results are not included in the EDD. The analyses were performed by the following methods:

Volatile Organic Compounds (VOC) by Environmental Protection Agency (EPA) SW-846 Method 8260B

VOC by EPA SW-846 Method 8260B in Selective Ion Monitoring (SIM) Mode

Metals by EPA Methods 200.7

Wet Chemistry:

Hexavalent Chromium by EPA Method 218.6

Chloride, Nitrate as Nitrogen, Nitrite as Nitrogen, and Sulfate (Anions) by EPA Method 300.0

Nitrate/Nitrite as Nitrogen and Total Inorganic Nitrogen (TIN) by Calculation

Chlorate by EPA Method 300.1B

Perchlorate by EPA Method 314.0

Ammonia as Nitrogen by EPA Method 350.1

Total Recoverable Phenolics (TRP) by EPA Method 420.4

Conductivity by Standard Method 2510B

Total Dissolved Solids (TDS) by Standard Method 2540C

Total Organic Carbon (TOC) by Standard Method 5310C

Total Organic Halogen (TOX) by EPA SW 846 Method 9020B

Field pH by Field Test Method

Laboratory analytical services were provided by Eurofins. Field pH readings were recorded on the chain-of-custody at the time of sampling and reported with the analytical data. The samples were grouped into sample delivery groups (SDGs). The water samples are associated with quality assurance and quality control (QA/QC) samples designed to document the data quality of the entire SDG or a sub-group of samples within an SDG. Table I is a cross-reference table listing each sample, analysis, SDG, collection date, laboratory sample number, matrix, and validation level. An individual sample may be on multiple rows if it is reported on more than one SDG. Table II is a reference table that identifies the QC elements reviewed for each validation level per method, as applicable.

The laboratory analytical data were validated in accordance with procedures described in the Nevada Division of Environmental Protection (NDEP) *Data Validation Guidance* established for the BMI Plant Sites and Common Areas Projects, Henderson, Nevada, July 13, 2018. Consistent with the NDEP requirements, one hundred percent of the analytical data were validated according to Stage 2A data validation procedures. The number of analytical results for each method is presented in Table III.

The analytical data were evaluated for QA/QC based on the following documents: SAP Revision 1 (March 2020), *USEPA National Functional Guidelines (NFG) for Organic Superfund Methods Data Review* (January 2017) and *for Inorganic Superfund Methods Data Review* (January 2017); and the *EPA SW 846 Third Edition, Test Methods for Evaluating Solid Waste*, update I, July 1992; update IIA, August 1993; update II, September 1994; update IIB, January 1995; update III, December 1996; update IV, February 2007; update V, July 2014.

This report summarizes the QA/QC evaluation of the data according to precision, accuracy, representativeness, completeness, comparability, and sensitivity (PARCCS) relative to the project data quality objectives (DQOs). This report provides a quantitative and qualitative assessment of the data and identifies potential sources of error, uncertainty, and bias that may affect the overall usability.

PARCCS summary report evaluates and summarizes the results of QA/QC data validation for the entire sampling program. Each analytical fraction has a separate section for each of the PARCCS criteria. These sections interpret specific QC deviations and their effects on both individual data points and the analyses as a whole. Section 7.0 presents a summary of the PARCCS criteria by comparing quantitative parameters with acceptability criteria defined in the project DQO's. Qualitative PARCCS criteria are also summarized in this section.

### Precision and Accuracy of Environmental Data

Environmental data quality depends on sample collection procedures, analytical methods and instrumentation, documentation, and sample matrix properties. Both sampling procedures and laboratory analyses contain potential sources of uncertainty, error, and/or bias, which affect the overall quality of a measurement. Errors for sample data may result from incomplete equipment decontamination, inappropriate sampling techniques, sample heterogeneity, improper filtering, and improper preservation. The accuracy of analytical results is dependent on selecting appropriate analytical methods, maintaining equipment properly, and complying with QC requirements. The sample matrix also is an important factor in the ability to obtain precise and accurate results within a given media.

Environmental and laboratory QA/QC samples assess the effects of sampling procedures and evaluate laboratory contamination, laboratory performance, and matrix effects. QA/QC samples include: trip blanks (TB), equipment blanks (EB), field blanks (FB), field duplicates (FD), method blanks, laboratory control samples/laboratory control sample duplicates (LCS/LCSD), laboratory duplicates (DUP), and matrix spike/matrix spike duplicates (MS/MSD).

Before conducting the PARCCS evaluation, the analytical data were validated according to the NDEP Data Validation Guidance (July 2018), NFGs (USEPA 2017), and EPA SW 846 Test Methods. Samples not meeting the acceptance criteria were qualified with a flag, an abbreviation indicating a deficiency with the data. The following are flags used in data validation.

- J-     Estimated The associated numerical value is an estimated quantity with a negative bias. The analyte was detected but the reported value may not be accurate or precise.
- J+     Estimated The associated numerical value is an estimated quantity with a positive bias. The analyte was detected but the reported value may not be accurate or precise.
- J       Estimated The associated numerical value is an estimated quantity. It is not possible to assess the direction of the potential bias. The analyte was detected but the reported value may not be accurate or precise. The "J" qualification indicates the data fell outside the QC limits, but the exceedance was not sufficient to cause rejection of the data.
- R       Rejected The data is unusable (the analyte may or may not be present). Use of the "R" qualifier indicates a significant variance from functional guideline acceptance criteria. Either resampling or reanalysis is necessary to determine the presence or absence of the rejected analyte.
- U       Nondetected Analyses were performed for the analyte, but it was not detected.
- UJ      Estimated/Nondetected Analyses were performed for the analyte, but it was not detected, and the sample quantitation or detection limit is an estimated quantity due to poor accuracy or precision.

This qualification is also used to flag possible false negative results in the case where low bias in the analytical system is indicated by low calibration response, surrogate, or other spike recovery.

DNR Do Not Report A more appropriate result is reported from another analysis or dilution.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

The hierarchy of flags is listed below:

R > J The R flag will always take precedence over the J qualifier.

J+ The high bias (J+) flag is applied only to detected results.

J > J+ or J- A non-biased (J) flag will always supersede biased (J+ or J-) flags since it is not possible to assess the direction of the potential bias.

J = J+ plus J- Adding biased (J+, J-) flags with opposite signs will result in a non-biased flag (J).

UJ = U plus J The UJ flag is used when a non-detected (U) flag is added to a non-biased flag (J).

Table IV lists the reason codes used. Reason codes explain why flags have been applied and allow data users to assess if a result is usable with qualification due to QA/QC outliers or not usable when rejected due to QA/QC outliers. Reason codes are cumulative except when one of the flags is R then only the reason code associated to the R flag will be used.

Table V presents the overall qualified results after all the flags or validation qualifiers and associated reason codes have been applied.

Once the data are reviewed and qualified according to the NDEP Data Validation Guidance (July 2018), NFG, and EPA Test Methods, the data set is then evaluated using PARCCS criteria. PARCCS criteria provide an evaluation of overall data usability. The following is a discussion of PARCCS criteria as related to the project DQOs.

**Precision** is a measure of the agreement or reproducibility of analytical results under a given set of conditions. It is a quantity that cannot be measured directly but is calculated from reported concentrations.

Precision is expressed as the relative percent difference (RPD):

$$RPD = (D1 - D2) / \{1/2(D1 + D2)\} \times 100$$

where:

D1 = reported concentration for the sample

D2 = reported concentration for the duplicate

Precision is primarily assessed by calculating an RPD from the reported concentrations of the spiked compounds for each sample in the MS/MSD pair. In the absence of an MS/MSD pair, a laboratory duplicate or LCS/LCSD pair can be analyzed as an alternative means of assessing precision.

An additional measure of sampling precision was obtained by collecting and analyzing field duplicate

samples, which were compared using the RPD result as the evaluation criteria.

MS and MSD samples are field samples spiked by the laboratory with target analytes prior to preparation and analysis. These samples measure the overall efficiency of the analytical method in recovering target analytes from an environmental matrix. An LCS is similar to an MS/MSD sample in that the LCS is spiked with the same target analytes prior to preparation and analysis. However, the LCS is prepared using a controlled interference-free matrix instead of a field sample aliquot. Laboratory reagent water is used to prepare aqueous LCS. The LCS measures laboratory efficiency in recovering target analytes from an aqueous matrix in the absence of matrix interferences.

DUPs measure laboratory precision. DUPs are replicate samples and are prepared by taking two aliquots from one sample container. The analytical results for DUPs are reported as the RPD between the results of the two aliquots.

Laboratory and field sampling precision are evaluated by calculating RPDs for field sample duplicate pairs. The sampler collects two field samples at the same location and under identically controlled conditions. The laboratory then analyzes the samples under identical conditions.

An RPD outside the numerical QC limit in the LCS/LCSD, MS/MSD, DUPs, or field duplicates indicates imprecision. Imprecision is the variance in the consistency with which the laboratory arrives at a particular reported result. Thus, the actual analyte concentration may be higher or lower than the reported result.

Possible causes of poor precision include sample heterogeneity, improper sample collection or handling, inconsistent sample preparation, and poor instrument stability. In some duplicate pairs, results maybe reported in either the primary or duplicate samples at levels below the practical quantitation limit (PQL) or non-detected. Since these values are considered to be estimates, RPD exceedances from these duplicate pairs do not suggest a significant impact on the data quality.

**Accuracy** is a measure of the agreement of an experimental determination and the true value of the parameter being measured. It is used to identify bias in a given measurement system. Recoveries outside acceptable QC limits may be caused by factors such as instrumentation, analyst error, or matrix interference. Accuracy is assessed through the analysis of MS, MSD, LCS, and samples containing surrogate spikes. In some cases, samples from multiple SDGs were within one QC batch and therefore are associated with the same laboratory QC samples. Surrogate spikes are either isotopically labeled compounds or compounds that are not typically detected in the samples. Surrogate spikes are added to every blank, environmental sample, LCS, MS/MSD, and standard, for all applicable organic analyses. Accuracy of inorganic analyses is determined using the percent recoveries of MS and LCS analyses.

Percent recovery (%R) is calculated using the following equation:

$$\%R = (A-B)/C \times 100$$

where:

A = measured concentration in the spiked sample

B = measured concentration of the spike compound in the unspiked sample

C = concentration of the spike

The percent recovery of each analyte spiked in MS/MSD samples, LCS/LCSD, and surrogate compounds added to environmental samples is evaluated with the acceptance criteria specified by the previously noted documents. Spike recoveries outside the acceptable QC accuracy limits provide an indication of bias, where the reported data may overestimate or underestimate the actual concentration of compounds detected or quantitation limits reported for environmental samples.

**Representativeness** is a qualitative parameter that expresses the degree to which the sample data are characteristic of a population. It is evaluated by reviewing the QC results of blanks, samples and holding times. Positive detects of compounds in the blank samples identify compounds that may have been introduced into the samples during sample collection, transport, preparation, or analysis. The QA/QC blanks collected and analyzed are method blanks, TBs, EBs, and FBs.

A method blank is a laboratory grade water or solid matrix that contains the method reagents and has undergone the same preparation and analysis as the environmental samples. The method blank provides a measure of the combined contamination derived from the laboratory source water, glassware, instruments, reagents, and sample preparation steps. Method blanks are prepared for each sample of a similar matrix extracted by the same method at a similar concentration level.

Trip blanks are used to identify possible volatile organic contamination introduced into the sample during transport. A trip blank is a sample bottle filled in the laboratory with reagent-grade water and preserved to a pH less than 2 with hydrochloric acid or solid matrix. It is transported to the site, stored with the sample containers, and returned unopened to the laboratory for analysis.

Equipment blanks consist of analyte-free water poured over or through the sample collection equipment. The water is collected in a sample container for laboratory analysis. These blanks are collected after the sampling equipment is decontaminated and measure effectiveness of the decontamination procedure.

Field blanks consist of analyte-free source water stored at the sample collection site. The water is collected from each source water used during each sampling event.

Holding times are evaluated to assure that the sample integrity is intact for accurate sample preparation and analysis. Holding times will be specific for each method and matrix analyzed. Holding time exceedance can cause loss of sample constituents due to biodegradation, precipitation, volatilization, and chemical degradation.

**Comparability** is a qualitative expression of the confidence with which one data set may be compared to another. It provides an assessment of the equivalence of the analytical results to data obtained from other analyses. It is important that data sets be comparable if they are used in conjunction with other data sets. The factors affecting comparability include the following: sample collection and handling techniques, matrix type, and analytical method. If these aspects of sampling and analysis are carried out according to standard analytical procedures, the data are considered comparable. Comparability is also dependent upon other PARCCS criteria, because only when precision, accuracy, and representativeness are known can data sets be compared with confidence.

**Completeness** is defined as the percentage of acceptable sample results compared to the total number of sample results. Completeness is evaluated to determine if an acceptable amount of usable data were obtained so that a valid scientific site assessment can be completed. Completeness equals the total number of sample results for each fraction minus the total number of rejected sample results divided by the total number of sample results multiplied by 100. As specified in the project DQOs, the goal for completeness for target analytes in each analytical fraction is 90 percent.

Percent completeness is calculated using the following equation:

$$\%C = (T - R)/T \times 100$$

where:

$\%C$  = percent completeness

T = total number of sample results

R = total number of rejected sample results

Completeness is also determined by comparing the planned number of samples per method and matrix as specified in the SAP Revision 1 (March 2020), with the number determined above.

**Sensitivity** is the ability of an analytical method or instrument to discriminate between measurement responses representing different concentrations. This capability is established during the planning phase to meet the DQOs. It is important that detection limits (DLs), and PQLs presented in the SAP Revision 1 (March 2020) are achieved and that target analytes can be detected at concentrations necessary to support the DQOs. The method detection limits (MDLs) represent the minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is greater than zero. Sample quantitation limits (SQLs) are adjusted MDL values that reflect sample specific actions, such as dilutions or varying aliquot sizes. PQLs are the lowest level at which the entire analytical system gives a recognizable signal and acceptable calibration point for the analyte. The laboratory is required to report detected analytes down to the SQL for this project. In addition, sample results are compared to method blank and field blank results to identify potential effects of laboratory background and field procedures on sensitivity.

The QA/QC criteria were met with the exceptions noted in the following sections for each analytical method.

## **2.0 VOLATILE ORGANIC COMPOUNDS**

All VOC data were assessed to be valid with the exception of four (4) of the 19,398 total results which were rejected based on MS/MSD %R exceedances. This section discusses the QA/QC supporting documentation as defined by the PARCCS criteria and evaluated based on the DQOs.

### **2.1 Precision and Accuracy**

#### **2.1.1 Surrogates**

All surrogate %Rs met the laboratory acceptance criteria.

#### **2.1.2 MS/MSD Samples**

Due to MS/MSD %Rs grossly outside the laboratory acceptance criteria (e.g.,  $\leq 0\%$ ), the styrene result in samples PC-130-20200507, PC-64-20200507-FD9, PC-40R-20200508, and MC-53-20200512-FD12 were qualified as rejected (R). Additionally, the ethyl tert-butyl ether result in sample M-80-20200513-FD4 and the styrene result in samples SWFTS-MW08C-20200505, MC-93-20200512, and M-80-20200513-FD4 were qualified non-detected estimated (UJ) as a result of MS/MSD %Rs below the laboratory acceptance criteria. The 1,1-dichloroethene result in sample UFMW-04D-20200514 was qualified as detected estimated (J+) as a result of MS/MSD %Rs above the laboratory acceptance criteria. The details regarding the qualification of results are provided in Attachment A.

In instances where MS/MSD %Rs and RPDs were above the laboratory acceptance criteria and the associated results were not detected or greater than 4X the spike concentration no data were qualified.

#### **2.1.3 LCS/LCSD Samples**

In instances where LCS/LCSD %Rs were above the laboratory acceptance criteria and the associated results were not detected, no data were qualified.

All LCS/LCSD RPDs met the laboratory acceptance criteria.

## **2.1.4 FD Samples**

Due to RPDs outside the acceptance criteria of  $\leq 30$ , four (4) tetrachloroethene results that were reported above the PQL in field duplicate samples PC-28-20200507 and PC-28-20200507-FD5 and field duplicate samples PC-64-20200507 and PC-64-20200507-FD9 were qualified as detected estimated (J). The details regarding the qualification of results are presented in Attachment A.

Given the additional uncertainty in results reported below the PQL, no data were qualified when the RPDs were outside the acceptance criteria and the associated results in either the primary or duplicate samples were below the PQL or not detected.

## **2.2 Representativeness**

### **2.2.1 Sample Preservation and Holding Times**

The evaluation of holding times to verify compliance with the method was conducted. All samples met the 14-day analysis holding time criteria for preserved water samples.

### **2.2.2 Blanks**

Method blanks, TBs, EBs, and FBs were collected and analyzed to evaluate representativeness. The concentration for an individual target compound in any of the types of QA/QC blanks was used for data qualification.

If contaminants were detected in a blank, corrective actions were made for the chemical analytical data during data validation. The corrective action consisted of amending the laboratory reported results based on the following criteria.

Results Below the PQL - Using professional judgment, if a sample result for the blank contaminant was less than the PQL and the sample result was less than or equal to 2 times the blank value, the sample result was qualified as detected estimated (J) at the reported concentration. Reason codes are applied to distinguish if the blank concentration was above or below the PQL.

Results Above the PQL - Using professional judgment, if a sample result for the blank contaminant was greater than the PQL and the sample result was less than or equal to 2 times the blank contaminant value, the sample result was qualified as detected estimated (J+) at the reported concentration. Reason codes are applied to distinguish if the blank concentration was above or below the PQL.

No Action - Using professional judgment, if a sample result for the blank contaminant was greater than 2 times the blank value, the result was not qualified.

For this data set, two times the blank value was used to assess all contaminants for organic methods. This allows the data not to be censored and provides an understanding of the level of contamination relative to that found in the samples. This approach is employed for all data sets collected for annual and semi-annual groundwater remedial performance sampling for the NERT site to ensure comparability.

#### **2.2.2.1 Method Blanks**

No contaminants were detected in the method blanks.

### **2.2.2.2 TBs**

As a result of contamination found in the associated trip blank, the chloroform result in samples M-103-20200515, M-138-20200515-FB16, and M-186D-20200515 were qualified as detected estimated (J). The details regarding the qualification of results are provided in Attachment A.

### **2.2.2.3 EBs and FBs**

As a result of contamination found in the associated equipment blanks, the chloroform result in samples PC-154-20200508 and M-205-20200512 were qualified as detected estimated (J+).

As a result of contamination found in the associated field blanks, the chloroform result in samples PC-55-20200506 and PC-142-20200507 were qualified as detected estimated (J+).

The details regarding the qualification of results are provided in Attachment A.

## **2.3 Comparability**

The laboratory used standard analytical methods for all of the analyses. In all cases, the SQLs attained were at or below the PQLs. Target compounds detected below the PQLs flagged (J) by the laboratory should be considered estimated. The comparability of the VOC data is regarded as acceptable.

## **2.4 Completeness**

The completeness level attained for VOC field samples was 99.98 percent. This percentage was calculated as the total number of accepted sample results divided by the total number of sample results multiplied by 100.

## **2.5 Sensitivity**

The calibration was evaluated for instrument sensitivity and was determined to be technically acceptable. All laboratory PQLs met the specified requirements described in the SAP Revision 1 (March 2020).

## **3.0 VOLATILE ORGANIC COMPOUNDS SIM**

All VOC SIM data were assessed to be valid since none of the 636 total results were rejected based on holding time and QC exceedances. This section discusses the QA/QC supporting documentation as defined by the PARCCS criteria and evaluated based on the DQOs.

### **3.1 Precision and Accuracy**

#### **3.1.1 Surrogates**

As a result of high surrogate %Rs, the 1,4-dioxane result in samples M-115-20200513 and M-75-20200513 and the 1,2,3-trichloropropane result in samples M-115-20200513, M-69-20200513, M-75-20200513, M-79-20200513, and M-83-20200513 were qualified as detected estimated (J+). The details regarding the qualification of results are provided in Attachment B.

In instances where surrogate %Rs were above the laboratory acceptance criteria and the associated results were not detected no data were qualified.

### **3.1.2 MS/MSD Samples**

As a result of a high MSD %R, the 1,2,3-trichloropropane result in sample DFW-03-20200513 was qualified as detected estimated (J+). The details regarding the qualification of results are provided in Attachment B.

All MS/MSD RPDs met the laboratory acceptance criteria.

### **3.1.3 LCS Samples**

All LCS %Rs met the laboratory acceptance criteria.

### **3.1.4 FD Samples**

Due to RPDs outside the acceptance criteria of  $\leq 30$ , two (2) 1,2,3-Trichloropropane results that were reported above the PQL in field duplicate samples PC-94-20200505 and PC-94-20200505-FD6 were qualified as detected estimated (J). The details regarding the qualification of results are presented in Attachment B.

Given the additional uncertainty in results reported below the PQL, no data were qualified when the RPDs were outside the acceptance criteria and the associated results in either the primary or duplicate samples were below the PQL or not detected.

## **3.2 Representativeness**

### **3.2.1 Sample Preservation and Holding Times**

The evaluation of holding times to verify compliance with the method was conducted. All samples met the 14-day analysis holding time criteria for preserved water samples.

### **3.2.2 Blanks**

Method blanks, TBs, EBs, and FBs were collected and analyzed to evaluate representativeness.

If contaminants were detected in a blank, corrective actions were made for the chemical analytical data during data validation based on the criteria presented in Section 2.2.2.

#### **3.2.2.1 Method Blanks**

No contaminants were detected in the method blanks.

#### **3.2.2.2 TBs**

No contaminants were detected in the trip blanks.

#### **3.2.2.3 EBs and FBs**

No contaminants were detected in the equipment or field blanks.

## **3.3 Comparability**

The laboratory used standard analytical methods for all of the analyses. In all cases, the SQLs attained were at or below the PQLs. Target compounds detected below the PQLs flagged (J) by the laboratory

should be considered estimated. The comparability of the VOC data is regarded as acceptable.

### **3.4 Completeness**

The completeness level attained for VOC SIM field samples was 100 percent. This percentage was calculated as the total number of accepted sample results divided by the total number of sample results multiplied by 100.

### **3.5 Sensitivity**

The calibration was evaluated for instrument sensitivity and was determined to be technically acceptable. All laboratory PQLs met the specified requirements described in the SAP Revision 1 (March 2020).

## **4.0 METALS**

All metals data were assessed to be valid since none of the 756 total results were rejected based on holding time and QC exceedances. This section discusses the QA/QC supporting documentation as defined by the PARCCS criteria and evaluated based on the DQOs.

### **4.1 Precision and Accuracy**

#### **4.1.1 MS/MSD Samples**

As a result of high MS/MSD %Rs, the chromium result in 16 samples were qualified as detected estimated (J+). The details regarding the qualification of results are provided in Attachment C.

In instances where MS/MSD %Rs were above the laboratory acceptance criteria and the associated results were not detected or greater than 4X the spike concentration no data were qualified.

All MS/MSD RPDs met the laboratory acceptance criteria.

#### **4.1.2 LCS Samples**

All LCS %Rs met the laboratory acceptance criteria.

#### **4.1.3 FD Samples**

The field duplicate samples were evaluated for acceptable precision with RPDs for the compounds. All RPDs for results that were reported above the PQL met the acceptance criteria.

## **4.2 Representativeness**

### **4.2.1 Sample Preservation and Holding Times**

The evaluation of holding times to verify compliance with the method was conducted. All samples met the 180-day analysis holding time criteria.

#### **4.2.2 Blanks**

Method blanks, EBs, and FBs were analyzed to evaluate representativeness. The concentration for an individual target analyte in any of the types of QA/QC blanks was used for data qualification.

If contaminants were detected in a blank, corrective actions were made for the chemical analytical data

during data validation. The corrective action consisted of amending the laboratory reported results based on the following criteria.

Results Below the PQL - If a sample result was less than the PQL, the sample result was qualified as estimated (J) at the reported concentration. Reason codes are applied to distinguish if the blank concentration was above or below the PQL.

Results Above the PQL - If a sample result and blank contaminant value were greater than the PQL and the sample result was less than 10 times the blank contaminant value, the sample result was qualified as detected estimated (J+) at the reported concentration. Reason codes are applied to distinguish if the blank concentration was above or below the PQL.

No Action - If blank contaminant values were less than the PQL and associated sample results were greater than the PQL, or if blank contaminant values were greater than the PQL and associated sample results were greater than 10 times the blank contaminant value, the result was not qualified.

#### **4.2.2.1 Method Blanks**

As a result of contamination found in the associated method blanks, the chromium result in samples PC-115R-20200401, PC-116R-20200401-FD, PC-118-20200401, PC-120-20200401, PC-99R2/R3-20200401, and ART-2-20200401 were qualified as detected estimated (J). The details regarding the qualification of results are provided in Attachment C.

#### **4.2.2.2 EBs and FBs**

No data were qualified due to the contaminants detected in the equipment and field blanks.

### **4.3 Comparability**

The laboratory used standard analytical methods for all of the analyses. In all cases, the SQLs attained were at or below the PQLs. Target analytes detected below the PQLs flagged (J) by the laboratory should be considered estimated. The comparability of the metals data is regarded as acceptable.

### **4.4 Completeness**

The completeness level attained for metal field samples was 100 percent. This percentage was calculated as the total number of accepted sample results divided by the total number of sample results multiplied by 100.

### **4.5 Sensitivity**

The calibration was evaluated for instrument sensitivity and was determined to be technically acceptable. All laboratory PQLs were acceptable.

## **5.0 WET CHEMISTRY**

All wet chemistry data were assessed to be valid since none of the 4,071 total results were rejected based on holding time and QC exceedances. This section discusses the QA/QC supporting documentation as defined by the PARCCS criteria and evaluated based on the DQOs.

## **5.1 Precision and Accuracy**

### **5.1.1 Surrogate**

The chlorate result in sample M-129-20200518 was qualified as detected estimated (J+) as a result of surrogate %R above the laboratory acceptance criteria. The details regarding the qualification of results are provided in Attachment D.

### **5.1.2 MS/MSD Samples**

MS/MSD samples were evaluated for anions, hexavalent chromium, chlorate, perchlorate, and TOC.

Twenty-four (24) nitrate as nitrogen, 23 perchlorate, 14 chlorate, and 7 hexavalent chromium results were qualified as detected estimated (J-) or non-detected estimated (UJ) due to MS/MSD %Rs below the laboratory acceptance criteria.

Eighty-nine (89) nitrate as nitrogen, 40 perchlorate, and 19 hexavalent chromium results were qualified as detected estimated (J+) due to MS/MSD %Rs above the laboratory acceptance criteria.

Nine (9) perchlorate results were qualified as non-detected (UJ) due to MS/MSD RPDs above the laboratory acceptance criteria.

The details regarding the qualification of results are presented in Attachment D.

In instances where MS/MSD %Rs were above the laboratory acceptance criteria and the associated results were not detected or greater than 4X the spike concentration no data were qualified.

### **5.1.3 DUP Samples**

DUP samples were evaluated for TDS and conductivity. All DUP RPDs met the laboratory criteria.

### **5.1.4 LCS Samples**

All LCS %Rs met the laboratory acceptance criteria

### **5.1.5 FD Samples**

Due to RPDs outside the acceptance criteria of  $\leq 30$ , two (2) chlorate results that were reported above the PQL in field duplicate samples ES-11-20200521 and ES-11-20200521-FD22 were qualified as detected estimated (J). The details regarding the qualification of results are presented in Attachment D.

## **5.2 Representativeness**

### **5.2.1 Sample Preservation and Holding Times**

The evaluation of holding times to verify compliance with all wet chemistry methods was conducted. All water samples met the 24-hour analysis holding time criteria for hexavalent chromium, 48-hour analysis holding time criteria for nitrite as nitrogen, and the 28-day analysis holding time criteria for ammonia as nitrogen, chlorate, chloride, conductivity, perchlorate, phenolics, sulfate, TOC, and TOX.

One (1) nitrate as nitrogen was qualified as detected estimated (J-) as a result of exceeding the analysis holding time criteria of 48 hours and two (2) TDS results were qualified as detected estimated (J-) as a result of exceeding the analysis holding time criteria of seven days.

## **5.2.2 Blanks**

Method blanks, EBs, and FBs were analyzed to evaluate representativeness.

If contaminants were detected in a blank, corrective actions were made for the chemical analytical data during data validation based on the criteria presented in Section 4.2.2.

### **5.2.2.1 Method Blanks**

No contaminants were detected in the method blanks.

### **5.2.2.2 EBs and FBs**

No data were qualified due to the contaminants detected in the equipment and field blanks.

## **5.3 Comparability**

The laboratory used standard analytical methods for all of the analyses. In all cases, the SQLs attained were at or below the PQLs. Target analytes detected below the PQLs flagged (J) by the laboratory should be considered estimated. The comparability of the data is regarded as acceptable.

In the case where more than one result was reported for an individual sample, the least technically acceptable results were deemed not reportable. Due to raised baseline from carryover of previous sample, the reanalysis nitrate as nitrogen result for sample M-73-20200511 was more usable.

## **5.4 Completeness**

The completeness level attained for wet chemistry field samples was 100 percent. This percentage was calculated as the total number of accepted sample results divided by the total number of sample results multiplied by 100.

## **5.5 Sensitivity**

The calibration was evaluated for instrument sensitivity and was determined to be technically acceptable. All laboratory PQLs were acceptable.

## **6.0 VARIANCES IN ANALYTICAL PERFORMANCE**

The laboratory used standard analytical methods for all analyses throughout the project. The analyses were conducted within all specifications of the method.

No systematic variances in analytical performance were noted in the laboratory case narratives.

## **7.0 SUMMARY OF PARCCS CRITERIA**

The validation reports present the PARCCS results for all SDGs. Each PARCCS criterion is discussed in detail in the following sections.

### **7.1 Precision and Accuracy**

Precision and accuracy were evaluated using data quality indicators such as surrogates, MS/MSD, DUP, LCS/LCSD, and field duplicates. The precision and accuracy of the data set were considered acceptable after integration of result qualification.

All surrogate, MS/MSD, DUP, LCS/LCSD, and field duplicate percent recoveries and RPDs met acceptance criteria with the exceptions noted in Sections 2.1.2, 2.1.4, 3.1.1, 3.1.2, 3.1.4, 4.1.1, 5.1.1, 5.1.2 and 5.1.5.

## 7.2 Representativeness

All samples for each method and matrix were evaluated for holding time compliance. All holding times were met with the exception noted in Section 5.2.1. All samples were associated with a method blank in each individual SDG. The representativeness of the project data is considered acceptable after integration of result qualification due to blank contamination as noted in Sections 2.2.2.2, 2.2.2.3, and 4.2.2.1.

## 7.3 Comparability

Sampling frequency requirements were met in obtaining necessary field blanks and field duplicates. The laboratory used standard analytical methods for the analyses. The analytical results were reported in correct standard units. Sample integrity criteria were met and sample preservation and holding times were within QC criteria with the exception noted in Section 5.2.1. The overall comparability is considered acceptable after integration of result qualification.

## 7.4 Completeness

Of the 24,861 total analytes reported, four (4) of the results were rejected. The completeness for the SDGs is as follows:

Parameter	Total Number of Validated Results	Number of Rejected Results	Percent Completeness
VOC	19,398	4	99.98
VOC SIM	636	0	100
Metals	756	0	100
Wet Chemistry:			
CrVI	401	0	100
Anions	690	0	100
TIN and NO <sub>3</sub> /NO <sub>2</sub> -N	4	0	100
Chlorate	1004	0	100
Perchlorate	1014	0	100
Ammonia-N	2	0	100
Total Recoverable Phenolics	4	0	100
Conductivity	4	0	100
TDS	940	0	100
TOC	4	0	100
TOX	4	0	100
<b>Total</b>	<b>24,861</b>	<b>4</b>	<b>99.98</b>

The completeness percentage based on rejected data met the 90 percent DQO goal.

## 7.5 Sensitivity

Sensitivity was achieved by the laboratory to support the DQOs. Calibration concentrations, VOC SQLs, metals and wet chemistry PQLs met the project requirements and low-level contamination in the method blanks, trip blanks, equipment blanks, and field blanks did not affect sensitivity.

## **8.0 CONCLUSIONS AND RECOMMENDATIONS**

The analytical data quality assessment for the water sample laboratory analytical results generated during the January to June 2020 Annual Remedial Performance Sampling at the NERT site in Henderson, Nevada established that the overall project requirements and completeness levels were met. Sample results that were found to be rejected (R) are unusable for all purposes. Sample results that were found to be estimated (J) are usable for limited purposes only. Based upon the Stage 2A data validation, all other results are considered valid and usable for all purposes.

**Table IV. Reason Codes and Definitions**

Reason Code	Explanation
a	qualified due to low abundance ( radiochemical activity)
be	qualified due to equipment blank contamination
bf	qualified due to field blank contamination
bl	qualified due to lab blank contamination
bt	qualified due to trip blank contamination
bp	qualified due to pump blank contamination (wells w/o dedicated pumps, when contamination is detected in the Pump Blk)
br	qualified due to filter blank contamination (aqueous Hexavalent Chromium and Dissolved sample fractions)
c	qualified due to calibration problems
cp	qualified due to insufficient ingrowth (radiochemical only)
dc	dual column confirmation RPD exceeded
e	concentration exceeded the calibration range
fd	qualified due to field duplicate imprecision
h	qualified due to holding time exceedance
i	qualified due to internal standard areas
k	qualified as Estimated Maximum Possible Concentrations (dioxins and PCB congeners)
l	qualified due to LCS recoveries
ld	qualified due to lab duplicate imprecision (matrix duplicate, MSD, LCSD)
m	qualified due to matrix spike recoveries
nb	qualified due to negative lab blank contamination (nondetect results only)
nd	qualified due to non-detected target analyte
o	other
orr	other result reported
p	qualified as a false positive due to contamination during shipping
pH	sample preservation not within acceptance range
q	qualified due to quantitation problem
s	qualified due to surrogate recoveries
sd	serial dilution did not meet control criteria
sp	detected value reported >SQL <PQL
st	sample receipt temperature exceeded
t	qualified due to elevated helium tracer concentrations
vh	volatile headspace detected in aqueous sample containers submitted for VOC analysis
x	qualified due to low % solids
z	qualified due to ICS results

**I. Sample Receipt and Technical Holding Times**

All samples were received in good condition and cooler temperatures upon receipt met validation criteria.

All technical holding time requirements were met.

**II. Laboratory Blanks**

Laboratory blanks were analyzed as required by the method. No contaminants were found in the laboratory blanks.

**III. Field Blanks**

## **VIII. Compound Quantitation**

Raw data were not reviewed for Stage 2A validation.

## **IX. Overall Assessment of Data**

The analysis was conducted within all specifications of the method.

Due to MS/MSD %R, data were rejected in four samples.

Due to MS/MSD %R and field duplicate RPD, data were qualified as estimated in eight samples.

Due to trip blank contamination, data were qualified as estimated in three samples.

Due to equipment blank contamination, data were qualified as estimated in two samples.

Due to field blank contamination, data were qualified as estimated in two samples.

NQ = No data were qualified when either the primary or duplicate result was not detected or was below the practical quantitation limit (PQL).

## VIII. Compound Quantitation

Raw data were not reviewed for Stage 2A validation.

## IX. Overall Assessment of Data

The analysis was conducted within all specifications of the method.

Due to surrogate %R, MS/MSD %R, and field duplicate RPD, data were qualified as estimated in eight samples.

#### IV. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) sample analysis was performed on an associated project sample. Percent recoveries (%R) were within QC limits with the following exceptions:

SDG	Spike ID (Associated Samples)	Analyte	MS (%R) (Limits)	MSD (%R) (Limits)	Flag	A or P
440-265912-1	TR-3-20200512MS/MSD (M-268-20200512 M-214-20200512 M-68-20200512 M-181-20200512 M-182-20200512 M-165-20200512 M-67-20200512 M-67-20200512-FD11 TR-3-20200512 M-161D-20200512 TR-1-20200512 MC-53-20200512 MC-53-20200512-FD12 M-207-20200512 M-265-20200512 M-212-20200512)	Chromium	153 (70-130)	210 (70-130)	J+ (all detects)	A

For M-10-20200204MS/MSD (from SDG 440-260227-1), no data were qualified for boron and iron percent recoveries (%R) outside the QC limits since the parent sample results were greater than 4X the spike concentration.

For I-X 20200109MS/MSD (from SDG 440-258824-1), I-O 20200113MS/MSD (from SDG 440-259000-1), I-X 20200212MS/MSD (from SDG 440-260825-1), I-V 20200213MS/MSD (from SDG 440-260949-1), ART-6 20200305MS/MSD (from SDG 440-262188-1), I-F 20200310MS/MSD (from SDG 440-262492-1), I-M 20200402MS/MSD (from SDG 440-263947-1), and I-G 20200402MS/MSD (from SDG 440-263963-1), no data were qualified for chromium percent recoveries (%R) outside the QC limits since the parent sample results were greater than 4X the spike concentration.

For TR-12-20200511MS/MSD, M-267-20200511MS/MSD (both from SDG 440-265853-1), and M-5A-20200514MS/MSD (from SDG 440-266033-1), no data were qualified for sodium percent recoveries (%R) outside the QC limits since the parent sample results were greater than 4X the spike concentration.

Relative percent differences (RPD) were within QC limits.

## **V. Duplicate Sample Analysis**

The laboratory has indicated that there were no duplicate (DUP) analyses specified for the samples in these SDGs, and therefore duplicate analyses were not performed for these SDGs.

## **VI. Serial Dilution**

Serial dilution was not performed for these SDGs.

## **VII. Laboratory Control Samples**

Laboratory control samples (LCS) were analyzed as required by the method. Percent recoveries (%R) were within QC limits.

## IX. Sample Result Verification

Raw data were not reviewed for Stage 2A validation.

## X. Overall Assessment of Data

The analysis was conducted within all specifications of the method.

Due to MS/MSD %R, data were qualified as estimated in seventeen samples.

Due to laboratory blank contamination, data were qualified as estimated in six samples.

No results were rejected in these SDGs.

### **Wet Chemistry Data Validation Report**

**Ammonia as Nitrogen by Environmental Protection Agency (EPA) Method 350.1**  
**Chlorate by EPA Method 300.1B**  
**Chloride, Nitrate as Nitrogen, Nitrite as Nitrogen, and Sulfate by EPA Method 300.0**  
**Conductivity by Standard Method 2510B**  
**Field pH**  
**Hexavalent Chromium by EPA Method 218.6**  
**Nitrate/Nitrite as Nitrogen by Calculation**  
**Perchlorate by EPA Method 314.0**  
**Total Recoverable Phenolics by EPA Method 420.4**  
**Total Dissolved Solids by Standard Method 2540C**  
**Total Inorganic Nitrogen by Calculation**  
**Total Organic Carbon by Standard Method 5310C**  
**Toxic Organic Halides by EPA SW 846 Method 9020B**

## **I. Sample Receipt and Technical Holding Times**

All samples were received in good condition.

All technical holding time requirements were met with the following exceptions:

SDG	Sample	Analyte	Total Time From Sample Collection Until Analysis	Required Holding Time From Sample Collection Until Analysis	Flag	A or P
440-264835-1	LVW4.75-1-0.8-20200414 LVW4.75-2-1.3-20200414	Total dissolved solids	9 days	7 days	J- (all detects)	P
440-265853-1	M-73-20200511RE	Nitrate as N	51.90 hours	48 hours	J- (all detects)	A

The laboratory indicated sample TR-7-20200518 (from SDG 440-266161-1) sterile container for perchlorate was received empty. The laboratory used non-sterile unpreserved poly-container for the analysis.

## **II. Laboratory Blanks**

Laboratory blanks were analyzed as required by the methods. No contaminants were found in the laboratory blanks.

## **III. Field Blanks**

## VI. Duplicate Sample Analysis

Duplicate (DUP) sample analysis was performed on an associated project sample. Results were within QC limits.

## VII. Laboratory Control Samples

Laboratory control samples (LCS) were analyzed as required by the method. Percent recoveries (%R) were within QC limits.

## VIII. Field Duplicates

## IX. Sample Result Verification

Raw data were not reviewed for Stage 2A validation.

## X. Overall Assessment of Data

The analysis was conducted within all specifications of the methods.

In the case where more than one result was reported for an individual sample, the least technically acceptable results were deemed not reportable as follows:

SDG	Sample	Analyte	Reason	Flag	A or P
440-265853-1	M-73-20200511	Nitrate as N	Raised baseline from carryover of previous sample, reanalysis is more usable.	Do not report	-

Due to technical holding time and MS/MSD %R, data were qualified as estimated in two hundred-eleven samples.

No results were rejected in these SDGs.
