

TECHNICAL MEMORANDUM

To: Nevada Environmental Response Trust

Cc: Nevada Division of Environmental Protection
United States Environmental Protection Agency

From: Dana Grady

Date: February 10, 2023

Subject: Seep Well Field Area Bioremediation Treatability Study Quarterly Progress Report

At the direction of the Nevada Environmental Response Trust (NERT or Trust), Tetra Tech, Inc. (Tetra Tech) has prepared this memorandum to summarize Tetra Tech's progress from October to December 2022 toward successfully implementing the Seep Well Field (SWF) Area Bioremediation Treatability Study.

Task Progress Update: October 2022 – December 2022

Task M11 – Seep Well Field Area Bioremediation Treatability Study (SWFTS)

- Task Leader – Dana Grady
- Current Status
 - As presented in Treatability/Pilot Study Modification No. 6, the ongoing efforts related to the SWF Area Bioremediation Treatability Study focus on refinement of operations and maintenance techniques (O&M) associated with long-term implementation of in situ bioremediation (ISB) in the vicinity of the SWF and Las Vegas Wash. Figure 1 provides a map of the injection and monitoring well locations for reference. Well construction details and a summary of the groundwater analytical results for perchlorate, chlorate, nitrate, total organic carbon (TOC), and dissolved oxygen through September 2022 are provided in Tables 1 and 2, respectively.
 - O&M of SWF Area Bioremediation Treatability Study:
 - Injection Activities – No injection activities were performed during this quarterly reporting period. The most recent (eighth) injection event was performed in November 2021 and was summarized in the October – December 2021 Quarterly Progress Report.
 - Maintenance Activities – No maintenance activities were performed during this quarterly reporting period. The most recent maintenance event was performed in February 2021 and was summarized in the January – March 2021 Quarterly Progress Report.
 - Performance of the SWF Area Bioremediation Treatability Study:
 - Groundwater perchlorate concentration reductions compared to baseline conditions continue to be observed at most monitoring wells within the treatability study area, even after one year following the last carbon donor injection. During this quarterly reporting

period, groundwater sampling activities were performed from December 12 – December 15, 2022. Groundwater samples could not be collected from three monitoring wells, namely, SWFTS-MW05A/B and SWFTS-MW08A, due to access restrictions related to the Cadence Sports Park construction activities. Groundwater analytical results from the December 2022 sampling event will be provided in future quarterly progress reports when all data are received from the laboratory. During this quarterly reporting period, results were received from the September 2022 groundwater sampling event (performed from September 12 – September 15, 2022) and are summarized below.

- Laboratory results indicated that groundwater samples collected in December 2021 from upgradient monitoring wells SWFTS-MW07A/B and SWFTS-MW11 exhibited perchlorate concentrations ranging from 20,000 to 26,000 micrograms per liter ($\mu\text{g/L}$), which represents the highest upgradient perchlorate concentrations since the start of the treatability study. Since the peak concentrations observed in December 2021, the perchlorate concentrations in groundwater samples collected from these upgradient locations have exhibited a decreasing trend, which continued during the September 2022 sampling event with perchlorate concentrations ranging from 8,300 to 16,000 $\mu\text{g/L}$. Other notable results from September 2022 include a perchlorate concentration of 22,000 $\mu\text{g/L}$ in the groundwater sample collected from monitoring well PC-88 (located adjacent SWF extraction wells PC-99R2 and R3), which represents the highest perchlorate concentration detected in groundwater from this well since the start of the treatability study. Groundwater concentrations in samples collected from upgradient monitoring wells will be evaluated for long-term concentration trends/large fluctuations and be discussed in detail in the forthcoming Annual Progress Report.
- Noteworthy findings from the four monitoring wells located between the injection well transects are described below:
 - Following the eighth injection event performed in November 2021, perchlorate concentrations in groundwater samples collected from SWFTS-MW02 have been as low as 600 $\mu\text{g/L}$. However, the perchlorate groundwater concentration increased during the September 2022 sampling event to 15,000 $\mu\text{g/L}$. The increase in perchlorate concentration in groundwater at this well correlates with increasing chlorate and nitrate concentrations and is likely due to the length of time that has elapsed since the last injection event.
 - Following the eighth injection event, the groundwater sample collected in December 2021 from monitoring well SWFTS-MW14 indicated that perchlorate concentrations decreased significantly to 670 $\mu\text{g/L}$, which represented a reduction of 97% from the baseline concentration. Concentrations of perchlorate at this location have since increased over time to 7,800 $\mu\text{g/L}$ in the September 2022 sampling event. This still represents a 66 percent reduction compared to the baseline concentration but is a notable increase when compared to long-term concentration trends in groundwater samples collected from this location. As part of the final year of system monitoring with no active injection activities, this gradual increase is expected due to the ten months that have elapsed since the eighth and final injection event, which has likely resulted in changing and gradually unfavorable geochemical conditions.

- Groundwater samples collected from SWFTS-MW15 have generally indicated a slow response to the addition of emulsified vegetable oil throughout the treatability study. This may potentially be due to preferential flow pathways for carbon substrate migration, heterogeneity of the subsurface creating a potential dead zone, perchlorate upflux from the UMCf, and/or paleochannel effects. The September 2022 groundwater sample collected from SWFTS-MW15 indicated a groundwater perchlorate concentration of 7,400 µg/L, which is 51 percent lower than the baseline concentration of 15,000 µg/L. Perchlorate fluctuations in groundwater samples collected from this monitoring well will continue to be evaluated.
- The concentration of perchlorate in groundwater from SWFTS-MW16 has further decreased from 740 µg/L to 260 µg/L between the June 2022 and September 2022 sampling events, which represents a 97 percent decrease compared to the baseline concentration.
- Groundwater samples collected from 11 of the 14 downgradient monitoring wells sampled during the September 2022 sampling event indicated perchlorate concentration reductions when compared to baseline concentrations. Noteworthy findings are described below:
 - Perchlorate concentrations in groundwater samples collected from downgradient monitoring wells PC-91 and SWFTS-MW20 continued to show significant reductions compared to baseline conditions, with perchlorate concentrations in groundwater samples collected from both monitoring wells measuring 10 µg/L in the September 2022 sampling event (representing reductions of greater than 99 percent when compared to baseline).
 - Several monitoring wells associated with the paleochannel and/or screened in sediments with high hydraulic conductivities (PC-94, SWFTS-MW09A/B, and SWFTS-MW25) indicated perchlorate concentrations ranging from 7,900 µg/L to 12,000 µg/L during the September 2022 sampling event, which were lower than the results from the June 2022 sampling event. Results observed in groundwater at these monitoring wells likely reflect the trends observed upgradient in the vicinity of the paleochannel where record high concentrations observed in December 2021 continued to decrease slowly over time. These wells will continue to be sampled and results evaluated for future trends.
- Chlorate concentrations in groundwater follow trends similar to perchlorate, with greater than 70% reduction in chlorate concentrations in groundwater samples collected from 10 monitoring wells located between the injection well transects and downgradient during the September 2022 sampling event when compared to baseline.
- Nitrate concentrations in groundwater were also evaluated since it is often a competing electron acceptor and carbon substrate consumer. When nitrate concentrations increase over time following discontinuation of injections, this could be the first signal for depletion of carbon substrates. Nitrate concentrations in groundwater were generally greater than 10 milligrams per liter (mg/L) during the baseline sampling event. During the September 2022 sampling event, groundwater samples collected from four downgradient monitoring wells

exhibited nitrate concentrations of less than 5 mg/L, which generally represents a concentration reduction of at least 85% or greater compared to baseline.

- Groundwater perchlorate concentrations in samples collected from upgradient well SWFTS-MW12 continue to remain reduced (360 µg/L in September 2022 compared to a baseline concentration of 5,100 µg/L). As detailed during previous progress and annual reports, this well is located approximately 150 feet upgradient from the injection wells and is the well from which most of the distribution water was extracted during the fifth injection event. Modifications were made in subsequent injection events to decrease the volume of groundwater extracted from SWFTS-MW12 compared to previous injection events to potentially reduce the effect of groundwater extraction during injections on concentrations at SWFTS-MW12.
- Schedule and Progress Updates
 - The field component of the SWF Treatability Study, including extended operations as detailed in Treatability/Pilot Study Modification No. 6, concluded in December 2022.
 - All injection and monitoring wells will be abandoned in February 2023.
 - The 2022 Annual Progress Report will be submitted in the second quarter 2023. Per NDEP request, a Comprehensive Final Report will be prepared following receipt of comments on the 2022 Annual Progress Report.
- Health and Safety
 - There were no safety incidents related to Task M11 during the reporting period October through December 2022.

CERTIFICATION

Seep Well Field Area Bioremediation Treatability Study Quarterly Progress Report

**Nevada Environmental Response Trust Site
(Former Tronox LLC Site)
Henderson, Nevada**

Nevada Environmental Response Trust (NERT) Representative Certification

I certify that this document and all attachments submitted to the Division were prepared at the request of, or under the direction or supervision of NERT. Based on my own involvement and/or my inquiry of the person or persons who manage the systems(s) or those directly responsible for gathering the information or preparing the document, or the immediate supervisor of such person(s), the information submitted and provided herein is, to the best of my knowledge and belief, true, accurate, and complete in all material respects.

Notes:

amsl - above mean sea level

bTOC - below top of casing

bgs - below ground surface

UMCf - Upper Muddy Creek Formation

1. Baseline depth to water measurements were collected in July 2017.

Notes:

mg/L - milligrams per liter

µg/L - micrograms per liter

-- not analyzed

< The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.

J The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

J+ The result is an estimated quantity, but the result may be biased high.

J- The result is an estimated quantity, but the result may be biased low.

UJ The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

E Instrument error during sampling

- Monitoring well SWFTS-MW22 was not sampled during July 2021 (EM34) due to accessibility issues resulting from a storm event.
- Monitoring wells SWFTS-MW05A, SWFTS-MW05B, and SWFTS-MW08A were obstructed and not sampled for the March 2022 (EM37) event.
- Monitoring wells SWFTS-MW05A, SWFTS-MW05B, SWFTS-MW08A, and SWFTS-MW11 were obstructed and not sampled for the June 2022 (EM38) event.
- Monitoring wells SWFTS-MW05A, SWFTS-MW05B, and SWFTS-MW08A were obstructed and not sampled for the September 2022 (EM39) event.
