TABLE E-1. Background Data Used in the OU-1 Refined SLERA
Nevada Environmental Response Trust Site
Henderson, Nevada

Data Set	Origin	Sample ID	Location ID	Chemical Name	Result	Interpreted Qualifier	Unit	Rad Error	PQL	SQL	Depth (ft bgs)
BRC/TIMET	MCCULLOUGH	BRC-BKG-11C-0-0.5	BRC-BKG-11C	Zirconium	109	J	mg/kg		50.4	0.0874	0
BRC/TIMET	MCCULLOUGH	BRC-BKG-11C-4-6	BRC-BKG-11C	Zirconium	117	J	mg/kg		52.9	0.0874	5
BRC/TIMET	MCCULLOUGH	BRC-BKG-11C-9-11	BRC-BKG-11C	Zirconium	103	J	mg/kg		51.9	0.0874	10

Notes:
Some concentration values in the table are negative. Negative values may occur since sample counts are compared to background counts, and background counts reflect naturally occurring radionuclides and cosmic radiation that are detected by laboratory instrumentation. Samples that are not different from background may have a negative value when background radioactivity is subtracted.

µg/kg = Microgram per kilogram
ft bgs = Feet below ground surface
mg/kg = Milligram per kilogram
NERT = Nevada Environmental Response Trust
pCi/g = Average picoCuries per gram
PQL = Practical quantification level
OU-1 = Operable Unit 1
SLERA = Screening level ecological risk assessment
SQL = Sample quantification level

Lab Qualifiers:
B = Indicates that the analyte was found in the associated blank, as well as in the sample. It indicates possible/probable blank contamination and warns the data user to take appropriate action.
B J = Analyte detected in the associated method blank, result is estimated because is below the reporting limit for the analytical method
J = Indicates an estimated value.
J- = Indicates an estimated value with a negative bias.
J+ = Indicates an estimated value with a positive bias.
U = The analyte was not detected
UJ = The analyte was analyzed for and was not present above the level of the associated value.
UJ- = The analyte was analyzed for and was not present above the level of the associated value with a negative bias.

Notes:
mg/kg = milligram per kilogram
NA = value not available
p-values < 0.01 are shown in italic.
BRC/TIMET regional background dataset is used as background.
Shapiro Wilk tests use 1/2 the detection limit (DL) for non-detects.

Table E-2b. Background Comparisons for Metals in OU-1 Refined SLERA Study Area Soils

Nevada Environmental Response Trust Site

Henderson, Nevada

LDF = Low detection frequency (<25%) in either site or background datasets. Background comparison results may not be applicable.

NA = value not available

p- values in italics indicate p < 0.025

Background comparison tests use 1/2 the detection limit (DL) for non-detects in the parametric test (t-test) and the DL for non-parametric tests (Gehan test, quantile test, and slippage test).

BRC/TIMET regional background dataset is used as background.

For small sample size (<=100), final background determination is based on both parametric and non-parametric testing results.

For large sample size (>100), final background determination is based on non-parametric testing results only.

Distibution:

N = Study area data and background data consistent with normal distribution

LN = Study area data and background data consistent with log-normal distribution

NP = Study area data or background data is not consistent with both normal distribution and log-normal distribution.

Notes:

NA = value not available

p- values in italics indicate p < 0.025

Background comparison tests use 1/2 the detection limit (DL) for non-detects in the parametric test (t-test) and the DL for non-parametric tests (Gehan test, quantile test, and slippage test).

BRC/TIMET regional background dataset is used as background.

For small sample size (<=100), final background determination is based on both parametric and non-parametric testing results.

For large sample size (>100), final background determination is based on non-parametric testing results only.

Table E-2d. Background Comparisons for Radionuclides in OU-1 Refined SLERA Study Area Soils

Nevada Environmental Response Trust Site

Henderson, Nevada

Distibution:

N = Study area data and background data consistent with normal distribution

LN = Study area data and background data consistent with log-normal distribution

NP = Study area data or background data is not consistent with both normal distribution and log-normal distribution.

Note:

1. Analyzed using the R code used in EnviroGISdT software tool from Neptune & Company, Inc.

2. Tool states "in Secular Equilibrium" if the computed *p*-value is less than a standard significance level of 0.05.

3. Sample dataset includes field duplicates.

4. Count of sampling locations for which one or more results are unavailable. These sampling locations are not counted in the sample size and are not included in the secular equilibrium calculation.

5. Data Shift - Lists the values of the data shift utililzed by the tool in case of negative radioactivity measurements. All measurements values for that radioisotope are shifted upwards by the shift value so that all values are non-negative. A zero shift value indicates lack of negative measurements.

Notes:
(a) Neptune provided Ramboll with a copy of the R codes used for the UCL calculation on May 18, 2020.
(b) The maximum UCL value generated between the bias-corrected accelerated bootstrap method (BCa UCL) and the t-test method was selected as the UCL. If the maximum of the two UCLs was above the maximum detection, then the maximum detection was used as a surrogate. The selected values are shaded green.

95% UCL = 95% upper confidence level of the mean
BCa = bias-corrected accelerated
BHC = Hexachlorocyclohexane
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = Sum of all DDT metabolites
DL = Detection limit
DU = Ecological Decision Unit
mg/kg = milligram(s) per kilogram
ND = Not detected
OCPs = Organochlorine pesticides
OPPs = Organophosphate pesticides
OU-1 = Operable Unit 1
PCBs = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxic equivalency quotient
TPH = Total petroleum hydrocarbons
UCL = Upper confidence limit
VOCs = Volatile organic compounds

Notes:
(a) Non-detect results presented as 1/2 the detection limit.
(b) The source of ESVs and RSVs is as follows:

For manganese: The ESV is from the Eco-SSL (Eco-SSL 2007). The toxicity value (707 mg/kg) for the less-sensitive plant species (i.e., cotton and nile grass), as provided in the USEPA (2007) Eco-SSL derivation for terrestrial plants, is used as the RSV to further to characterize risk to terrestrial plants.

For perchlorate: The LANL database contains both LOAEL and NOAEL TRVs, which are used for ESVs and RSVs, respectively. The NOAEL TRV (ESV) provides an initial screening step to characterize risk while the LOAEL TRV (RSV) provides a more realistic look at the risk.

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100
1000	100 < HQ

DU = Decision Unit
Eco-SSL = Ecological soil screening level (USEPA 2007)
ESV = Ecological screening value
HQ = Hazard quotient
ID = Identification
LANL = Los Alamos National Laboratory (LANL 2018)
LOAEL = Lowest observed adverse effect level
mg/kg = Milligram per kilogram
N = Not detected
NOAEL = No observed adverse effect level
Region 4 = USEPA Region 4 (USEPA 2018)
RSV = Refined screening value
USEPA = United States Environmental Protection Agency
TRV = Toxicity reference value
Y = Detected

Notes:
(a) Non-detect results presented as 1/2 the detection limit.
(b) The source of ESVs and RSVs is as follows:

For manganese: The ESV is from the Eco-SSL (Eco-SSL 2007). A study by Phillips et al. (2002), as cited in USEPA (2007), provides a toxicity value of 1,209 mg/kg for springtails, a soil invertebrate, and is used as the RSV to characterize risk to terrestrial invertebrates in this table.

For mercury: The ESV is from USEPA Region 4. No RSV was identified. Conder et al. (2015) reported that mercury concentrations between 0.2 mg/kg and 1 mg/kg are a more accurate representation of toxicity to benthic invertebrates. It is assumed that sediment thresholds are protective of terrestrial invertebrates. The median of these two values is used as the RSV.

For perchlorate: The LANL database contains both LOAEL and NOAEL TRVs, which are used for ESVs and RSVs, respectively. The NOAEL TRV (ESV) provides an initial screening step to characterize risk while the LOAEL TRV (RSV) provides a more realistic look at the risk.

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100
1000	100 < HQ

DU = Decision Unit
Eco-SSL = Ecological soil screening level (USEPA 2007)
ESV = Ecological screening value
HQ = Hazard quotient
ID = Identification
LANL = Los Alamos National Laboratory (LANL 2018)
LOAEL = Lowest observed adverse effect level
mg/kg = Milligram per kilogram
N = Not detected
NOAEL = No observed adverse effect level
Region 4 = USEPA Region 4 (USEPA 2018)
RSV = Refined screening value
USEPA = United States Environmental Protection Agency
TRV = Toxicity reference value
Y = Detected

Notes:

BCF = Bioconcentration factor
BHC = Benzene hexachloride
Cp = Concentration in plant tissue (mg/kg dry weight)
Cs = Concentration in soil (mg/kg)
D/F = Dioxins and furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = Sum of all DDT isomers and metabolites
DL = Detection limit
DW = Dry weight
Koc = Soil adsorption coefficient
Kow = Partition coefficient
ln = Natural log
log = Logarithm
NA = Not applicable
ND = Non-detected concentrations
OCPs = Organochlorine pesticides
PCBs = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxic equivalent quotient

(d) USEPA. 1996. Soil Screening Guidance: Technical Background Document (EPA/540/R-95/128). Part 5: Chemical-Specific Parameters. July. Table 36 for Kows and Table 39 for Kocs. Geomean values used.

(e) The uptake value from soil to terrestrial plants for boron is based on professional judgement. Boron is not listed as a bioaccumulative compound in USEPA guidance but since it is a site constituent, then 0.1 is considered a reasonable estimate so that some food web modeling could occur.

1 2,3,7,8-Tetrachlorodibenzo-p-dioxin uptake value used as a surrogate.

2 Equation for combined DDD, DDE, and DDT used as a surrogate for individual isomers.

3 The BCF was calculated as: log BCF = 1.588 - 0.578 x log Kow (Travis and Arms 1988 as cited in USEPA Region 6 USEPA Region 6 [1999], Table C-2).

4 Aroclor 1016 and Aroclor 1254 BCF values used as a surrogate.

5 USEPA 2007 Eco-SSL guidance suggests an uptake factor of 1 where no uptake values are available.

TABLE H-1b: Food Web Uptake Approach for Soil to Terrestrial Invertebrates
Nevada Environmental Response Trust Site
Henderson, Nevada

Group	Chemical	Kow	Log (Kow)	Log (Koc)		Surface Soil to Terrestrial Invertebrate

Notes:

BCF = Bioconcenrtration factor
BHC = Benzene hexachloride
Ci = Concentration in invertebrate tissue (mg/kg dry weight)
Cs = Concentration in soil (mg/kg)
D/F = Dioxins and furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = Sum of all DDT isomers and metabolites
DL = Detection limit
DW = Dry weight
fOC = Fraction organic carbon
Koc = Soil adsorption coefficient
Kow = Partition coefficient
log = Logarithm
ln = Natural log
NA = Not applicable
ND = Non-detected concentrations
OCPs = Organochlorine pesticides
TEQ = Toxic equivalent quotient
WW = Wet weight

Johnson, US Army Center for Health Promotion and Preventive Medicine. Table 3.2-1. Average earthworm uptake value from soil. https://www.denix.osd.mil/cmrmp/chemicalmanagement/riskassessment/general-information/tech-memo/F

(b) Ramboll calculated uptake factor based on USEPA 2007. See text for more details regarding the calculation.

(c) USEPA. 2007. Guidance for Developing Ecological Soil Screening Levels (OSWER Directive 9285.7-55) Eco-SSL Guidance. Washington, D.C.: USEPA, Office of Solid Waste and Emergency Response. April.

(d) USEPA. 1996. Soil Screening Guidance: Technical Background Document (EPA/540/R-95/128). Part 5: Chemical-Specific Parameters. July. Table 36 for Kows and Table 39 for Kocs. Median values used.

(e) USEPA Region 6. 1999. Screening Level Ecological Risk Assessment Protocol for Hazardous Waste Combustion Facilities. Volume One (EPA530-D-99-001A). August.

(f) The uptake value from soil to terrestrial invertebrates for boron is based on professional judgement. Boron is not listed as a bioaccumulative compound in USEPA guidance but since it is a site constituent, then 0.1 is considered a reasonable estimate so that some food web modeling could occur.

1 Value for 2,3,7,8-TCDD used as a surrogate.

2 The site-specific uptake factor for dioxin and furan TEQs (as 2,3,7,8-TCDD) is 0.39 times the concentration in soil, for wet weight earthworms. Because earthworms would be expected to accumulate dioxins and furans from soil at a rate more readily than other invertebrates, such as crickets, grasshoppers, moths, and other invertebrates that are also in the food web, this value is reduced to 0.19 in calculating the total daily intake for a receptor. See Section 4.5.2 of main report for derivation of this value.

3 For organic compounds with no available BCFs, the BCFs were determined using the following equation: Concentration in worm = Concentration in soil x (10^(0.87*log Kow - 2))/(fOC x Koc). The latter part of the equation is the BCF. This is from the USEPA 2007 Eco-SSL guidance document, Section 3.2.2 and Table 5 of Attachment 4-1. The average of Operations Area surface soil fOC concentrations was used (0.0023 kg organic carbon/kg soil).

4 Aroclor 1016 and Aroclor 1254 BCF values used as a surrogate.

5 USEPA 2007 Eco-SSL guidance suggests an uptake factor of 1 where no uptake values are available.

TABLE H-1c: Food Web Uptake Approach for Soil to Prey Mammals
Nevada Environmental Response Trust Site
Henderson, Nevada

Group	Chemical	Surface Soil to Prey Mammal

(a) Smith, P.N., L. Yu, S.T. McMurry, T.A. Anderson. 2004. Perchlorate in Water, Soil, Vegetation, and Rodents collected from the Las Vegas Wash, Nevada, USA. Exposure Pollution 132(1): 121–127.

(b) USEPA Region 6. 1999. Screening Level Ecological Risk Assessment Protocol for Hazardous Waste Combustion Facilities. Volume One (EPA530-D-99-001A). August.

(c) USEPA. 2007. Guidance for Developing Ecological Soil Screening Levels (OSWER Directive 9285.7-55) Eco-SSL Guidance. Washington, D.C.: USEPA, Office of Solid Waste and Emergency Response. April.

(d) The uptake value from soil to terrestrial small mammals for boron is based on professional judgement. Boron is not listed as a bioaccumulative compound in USEPA guidance but since it is a site constituent, then 0.1 is considered a reasonable estimate so that some food web modeling could occur.

1 Value for 2,3,7,8-TCDD and least shrew used as a surrogate.

2 Value for DDE used as a surrogate.

3 No value available. Value for DDT from used as a surrogate.

4 USEPA 2007 Eco-SSL guidance suggests an uptake factor of 1 where no uptake values are available.

5 Value for Aroclor 1254 and least shrew used as a surrogate.

6 The site-specific uptake factor for organochlorine pesticides is based on the concentration of the pesticide in dry weight earthworms. Because earthworms would be expected to accumulate pesticides from soil at a rate more readily than other invertebrates, such as crickets, grasshoppers, moths, and other invertebrates that are also in the food web and more likely to be encountered at the site, the uptake into small mammals value is reduced by half in calculating the total daily intake for a receptor to reflect that half of the uptake from earthworms is the equivalent of the overall diet which includes other lesser exposed soil invertebrates.

7 Least shrew used as a surrogate.

TABLE H-2a: Coopers Hawk Exposure Parameters
Nevada Environmental Response Trust Site
Henderson, Nevada

Exposure Parameter	Description	Values Selected for Exposure and Risk Calculations
Cooper's Hawk	Order: Accipitriformes Family: Accipitridae Species: *Accipiter cooperii*	
Body Weight (BW) (kg)	Weight of male birds can range from 220-410 grams and weight of females birds can range from 330-680 grams (Cornell University 2017).	Average of 0.315 kg (male) Average of 0.505 kg (female) Average of 0.410 kg (both)
Dietary Makeup	Cooper's hawk are reported to forage primarily on medium-sized birds (approximately 60-80%), with small mammals making up the remainder. However, Bielefeldt et al. (1992) suggest that the methods used in most dietary studies overestimate the proportion of birds in the diet and that small mammals may constitute the primary food. (ORNL 1997).	60-80% Birds 20-40% Small Mammals
Ingestion Rate for Food (IRf) (kg ww/d)	Craighead and Craighead (1969, as cited in ORNL 1997) estimated the average consumption of two females and a male during spring and summer to be 0.165 grams of wet weight food per gram of body weight per day. This converts to 0.0677 kg ww food per day using an average body weight of 410 grams.	0.0677
Ingestion Rate for Water (IRw) (L/day)	Based on the allometric equation for water intake for all birds: Water Intake (L/day) = 0.059 $Wt^{0.67}$, where Wt is in kg (USEPA 1993).	0.03247
Ingestion Rate for Soil (IRs) (as % of diet)	Assume that soil consumption does not occur with predation of birds and mammals.	0%
Home Range (ha)	Reported home range size range from 400 to 1,800 ha during breeding season with a mean non-breeding range of 203 ha (18-531ha) (ORNL 1997)	203
Area Use Factor (AUF) (unitless)	The AUF is the ratio of the site area to the home range, not to exceed a maximum value of 1. Site areas: Operations Area (105 ha); Eco DU-1 (53.7 ha); Eco DU-2 (20.7 ha); Eco DU-3 (3.44 ha); Parcel E (3.48 ha).	Operations Area: 0.52 Eco DU-1: 0.26 Eco DU-2: 0.10 Eco DU-1: 0.017 Parcel E: 0.017
Exposure Frequency (EF) (unitless)	Brids from the northern potion of the range are migratory, although some stay resident year-round even in Canada. Southern birds may be locally migratory or more or less resident, leaving high elevations for more protected low elevations during winterNorthern populations migratory (ORNL 1997). Cooper's hawks at the site are presumed to be year-round residents.	1

Notes:
AUF = Area Use Factor
BW = Body weight
EF = Exposure frequency
g = Gram
ha = Hectare
IRf = Ingestion rate for food
IRs = Ingestion rate for soil
IRw = Ingestion rate for water
kg = Kilogram
L = Liter
Wt = Weight

TABLE H-2b: Kit Fox Exposure Parameters
Nevada Environmental Response Trust Site
Henderson, Nevada

Exposure Parameter	Description	Values Selected for Exposure and Risk Calculations
Kit Fox	Order: Carnivora Family: Canidae Species: *Vulpes macrotis*	
Body Weight (BW) (g)	The mean adult body weight for both males and females is 1.78 kg for kit foxes in Arizona (range 1.67 - 1.87 kg) (ORNL 1997).	1780 g
Dietary Makeup	Kit foxes are almost exclusively carnivorous, with primary prey being small mammals and rabbits (McGrew 1979, as cited in ORNL 1997).	100% Small Mammals
Ingestion Rate for Food (IRf) (kg ww/day)	Egoscue (1962, as cited in ORNL 1997) determined that captive kit foxes ate an average of 175 grams of fresh meat per day or 0.175 kg of wet food per day.	0.175
Ingestion Rate for Water (IRw) (L/day)	Kit foxes appear to obtain adequate moisture from their prey species (ORNL 1997).	0%
Ingestion Rate for Soil (IRs) (as % of diet)	Literature data on soil consumption for kit foxes could not be found; therefore, the value for red fox was used as a surrogate (ONRL 1997).	2.80%
Home Range (ha)	The overall average home range for kit foxes in Arizona was 1120 ± 94 ha (ORNL 1997).	1120
Area Use Factor (AUF) (unitless)	The AUF is the ratio of the site area to the home range, not to exceed a maximum value of 1. Site areas: Operations Area (105 ha); Eco DU-1 (53.7 ha); Eco DU-2 (20.7 ha); Eco DU-3 (3.44 ha); Parcel E (3.48 ha).	Operations Area: 0.094 Eco DU-1: 0.048 Eco DU-2: 0.018 Eco DU-1: 0.0031 Parcel E: 0.0031
Exposure Frequency	Kit foxes are non-migratory.	EF = 1

Notes:
AUF = Area Use Factor
BW = Body weight
EF = Exposure frequency
g = Gram
ha = Hectare
IRf = Ingestion rate for food
IRs = Ingestion rate for soil
IRw = Ingestion rate for water

TABLE H-2c: Burrowing Owl Exposure Parameters
Nevada Environmental Response Trust Site
Henderson, Nevada

Exposure Parameter	Description	Values Selected for Exposure and Risk Calculations
Burrowing Owl	Order: Strigiformes Family: Strigidae Species: *Athene cunicularia*	
Body Weight (BW) (kg)	The average body weight of burrowing owls in Colorado is 146.3 grams (males) and 156.1 grams (females) (ORNL 1997).	0.146 kg (male) 0.156 kg (female) 0.151 kg (both)
Dietary Makeup	Burrowing owls are opportunistic feeders, foraging on arthropods, small mammals, and small birds. Diets vary by season, according to availability of prey.	25% Small Mammals 75% Invertebrates
Ingestion Rate for Food (IRf) (kg ww/day)	Based on the allometric equation for non-passerine birds: food Intake (g/day) = 0.301 $Wt^{0.751}$, where Wt is in grams (USEPA 1993), and converted to wet weight using 70% moisture content (USEPA 1993).	0.043
Ingestion Rate for Water (IRw) (L/day)	Based on the allometric equation for water intake for all birds. Water Intake (L/day) = 0.059 $Wt^{0.67}$, where Wt is in kg. (USEPA 1993)	0.01663
Ingestion Rate for Soil (IRs) (as % of diet)	Sand, dirt, and rocks accounted for 0.12 to 15% of the volume of pellets of burrowing owls from California (ORNL 1997).	5% of diet
Home Range (ha)	Although the mean home range size of owls in Saskatchewan was 241 ha (range = 14-481 ha; Haug and Oliphant 1990 as cited in ORNL 1997), 95% of all movement occurred within 600 m of nest burrows.. Assumes circular home range with radius of 600m.	113
Area Use Factor (AUF) (unitless)	The AUF is the ratio of the site area to the home range, not to exceed a maximum value of 1. Site areas: Operations Area (105 ha); Eco DU-1 (53.7 ha); Eco DU-2 (20.7 ha); Eco DU-3 (3.44 ha); Parcel E (3.48 ha).	Operations Area: 0.93 Eco DU-1: 0.48 Eco DU-2: 0.18 Eco DU-1: 0.030 Parcel E: 0.031
Exposure Frequency	Generally year-round residents.	EF = 1

Notes:
AUF = Area Use Factor
BW = Body weight
EF = Exposure frequency
g = Gram
ha = Hectare

TABLE H-2d: American Robin Expsoure Parameters
Nevada Environmental Response Trust Site
Henderson, Nevada

Exposure Parameter	Description	Values Selected for Exposure and Risk Calculations
American Robin	Order: Passeriformes Family: Turdidae Species: *Turdus migratorius*	
Body Weight (BW) (kg)	Mean adult body weights range from 77 to 86 grams. The average mean adult body weight is approximately 81 grams (USEPA 1993).	0.081
Dietary Makeup	Robins forage by hopping along the ground in search of ground-dwelling invertebrates and by searching for fruit and foliage-dwelling insects in shrubs and low tree branches. In the months preceding and during the breeding season, robins feed mainly on invertebrates and on some fruits; during the remainder of the year, their diet consists primarily of fruits (USEPA 1993).	40 to 90% Invertebrates 10 to 60% Plants
Ingestion Rate for Food (IRf) (kg ww/day)	The average of two food ingestion rates (0.89 g/g-day and 1.52 g/g-day) for adults and juvenile robins was used (USEPA 1993). This was converted to 0.098 kg ww food/day using an average body weight of 0.081 kilograms.	0.098
Ingestion Rate for Water (IRw) (L/day)	Based on the allometric equation for water intake for all birds. Water Intake (L/day) = 0.059 $Wt^{0.67}$, where Wt is in kilograms (USEPA 1993).	0.011
Ingestion Rate for Soil (IRs) (as % of diet)	Information on soil ingestion in American robins could not be found. According to US Army (2004), both robins and woodcocks consume earthworms; however, earthworms comprise >60 percent and up to 99 percent of the American woodcock diet compared to <20 percent of the American robin diet (Howell, 1942). Therefore, the soil ingestion rate of 10.4% of the diet reported for American woodcocks is likely to be an extreme upperbound for the robin. If the soil ingestion rate is proportioned to the percent of earthworms in the diet, then soil would only make up 2.1 percent of the robin diet (USACHPPM 2004).	2%
Home Range (ha)	Mean home range sizes range for male and female adult robins are 0.15 to 0.81 ha. The average is approximately 0.30 ha (USEPA 1993).	0.48
Area Use Factor (AUF) (unitless)	The AUF is the ratio of the site area to the home range, not to exceed a maximum value of 1. The robins are assumed to forage exclusively on the site.	AUF=1 (all areas)
Exposure Frequency (EF) (unitless)	Most robins nesting in the northern United States and Canada winter in the Gulf Coast States and the Carolinas. Most northern robins leave their breeding grounds from September to November and return between February and April. Robins at the site are presumed to be year-round residents.	EF = 1

Notes:
AUF = Area Use Factor
BW = Body weight
EF = Exposure frequency
g = Gram
ha = Hectare

TABLE H-2e: Desert Shrew Exposure Parameters
Nevada Environmental Response Trust Site
Henderson, Nevada

Exposure Parameter	Description	Values Selected for Exposure and Risk Calculations
Desert Shrew	Order: Insectivora Family: Soricidae Species: *Nitiosorex crawfordi*	
Body Weight (BW) (kg)	The average weight is 4 g with a range from 3.5 to 4.5 g for adults (USACHPPM 2004).	0.0040
Dietary Makeup	Desert shrews are carnivorous, primarily insectivorous, but are nonselective in their diets. Common prey items include ground dwelling invertebrates such as crickets, cockroaches, grasshoppers, earwigs, and beetles as well as meal worms and cut worms. Occasionally they will eat centipedes and carrion such as dead birds, mammals, and reptiles, but will not eat live rodents (Armstrong and Jones, 1972; as cited in USACHPPM 2004).	95% Invertebrates 5% Small Mammals
Ingestion Rate for Food (IRf) (kg ww/day)	Dixon (1924; as cited in USACHPPM 2004) reported that a captive desert shrew consumed 2.3 g of food per day or 0.0023 kg of wet food per day. Desert shrews generally consume 75 percent or more of their body weight each day, and may consume food exceeding their own weight in a 24-hour period (USACHPPM 2004).	0.0023
Ingestion Rate for Water (IRw) (L/day)	Desert Shrews have extremely efficient kidneys relative to other shrews and a permanent source of water does not appear to be required. Where water is not available, the desert shrew appears to be able to obtain sufficient water for survival from its' food sources . If water is available, however, desert shrews will readily drink and are often found in the vicinity of a water source (USACHPPM 2004). Based on the allometric equation for all mammals (USEPA 1993): Water Intake L/day = 0.099 $Wt^{0.90}$, weight is in kilograms	0.0007
Ingestion Rate for Soil (IRs) (as % of diet)	Talmage and Walton (1993; as cited in USACHPPM 2004) reported a soil ingestion rate of 13 percent of the diet for short-tailed shrews and it is likely that desert shrews have a similar rate.	13%
Home Range (ha)	No information readily available regarding the home range of desert shrews in the wild. The home range of desert shrew is estimated to be between 0.08-0.72 hectares using the following equations (USACHPPM 2004), an average body weight of 4 grams, and converted to hectares (if needed): HR = 6.76 $Wt^{0.63}$, weight in kilograms (general equation) HR = 12.6 $Wt^{0.71}$, weight in kilograms (equation for hunters, which includes granivores, frugivores, insectivores, and carnivores) HR = 0.11 $Wt^{1.36}$, weight in grams (equation for carnivores) The average of the three calculated home ranges was used.	0.30
Area Use Factor (AUF) (unitless)	The AUF is the ratio of the site area to the home range, not to exceed a maximum value of 1. Shrew are assumed to forage exclusively on the site.	AUF=1 (all areas)
Exposure Frequency	Shrews do not migrate; therefore, a value of 1 will be used to represent the annual presence of indigenous populations (USEPA 1993).	EF=1

TABLE H-2f: Fringed Myotis Exposure Parameters
Nevada Environmental Response Trust Site
Henderson, Nevada

Exposure Parameter	Description	Values Selected for Exposure and Risk Calculations
Fringed Myotis (Mouse eared bat)	Order: Chiroptera Family: Vespertilionidae Species: *Myotis thysanodes*	
Body Weight (BW) (kg)	*Myotis thysanodes* is one of the larger *Myotis* species, with an adult weight of 5 to 9 grams (ADW 2002).	0.007
Dietary Makeup	Fringed myotis feed primarily on beetles and other insects such as moths, harvestman, crickets, flies, and spiders (CWHRS 2016; ADW 2002).	100% Invertebrates
Ingestion Rate for Food (IRf) (kg ww/day)	Food ingestion rate for fringed myotis was calculated based on the allometric equation for all mammals (USEPA 1993): Food Intake (kg/day) = 0.235 $Wt^{0.822}$, weight in grams It was converted to kg ww food/day using an approximate average of 75% moisture content in prey items (USEPA 1993).	0.0047
Ingestion Rate for Water (IRw) (L/day)	The ingestion rate for water is based on the allometric equation for all mammals (USEPA 1993): Water Intake (L/day) = 0.099 $Wt^{0.90}$, weight in kilograms	0.0011
Ingestion Rate for Soil (IRs) (as % of diet)	No published data were found concerning soil ingestion by fringed myotis; however, as an aerial insectivore, soil ingestion is assumed to be negligible.	0%
Home Range (hectares)	There is no information readily available on the home range of the fringed myotis; therefore, the home range of the spotted bat was used as a surrogate. In a study by Chamber et al. (2011) in Arizona, spotted bats had a home range of 297 km2, or 29,700 hectares.	29,700
Area Use Factor (AUF) (unitless)	The AUF is the ratio of the site area to the home range, not to exceed a maximum value of 1. Site areas: Operations Area (105 ha); Eco DU-1 (53.7 ha); Eco DU-2 (20.7 ha); Eco DU-3 (3.44 ha); Parcel E (3.48 ha).	Operations Area: 0.0035 Eco DU-1: 0.0018 Eco DU-2: 0.0007 Eco DU-1: 0.00012 Parcel E: 0.00012
Exposure Frequency	The species is migratory, making relatively short, local movements to suitable habitat (CWHRS 2016).	EF=1

Notes:
AUF = Area Use Factor
BW = Body weight
EF = Exposure frequency
g = Gram
ha = Hectare
IRf = Ingestion rate for food
IRs = Ingestion rate for soil
IRw = Ingestion rate for water

TABLE H-2g: Raccoon Exposure Parameters
Nevada Environmental Response Trust Site
Henderson, Nevada

Exposure Parameter	Description	Values Selected for Exposure and Risk Calculations
Raccoon	Order: Carnivora Family: Procyonidae Species: *Procyon lotor*	
Body Weight (BW) (kg)	Mean adult body weight ranges from 3.67 to 7.6 kilograms (kg) (USEPA 1993). The average mean body weights is 5.6 kg.	5.6
Dietary Makeup	Raccoons are omnivores and opportunistic eaters. They feed primarily on fleshy fruits, nuts, acorns, and corn but also eat grains, insects, frogs crayfish, eggs, and virtually any animal and vegetable matter. The proportion of different foods in their diet depends on location and season, although plants are usually a more important component of the diet (USEPA 1993).	40% Invertebrates 60% Plants
Ingestion Rate for Food (IRf) (kg ww/day)	Food ingestion rate was calculated using the allometric equation for all mammals (USEPA 1993): Food Intake (g/day) = 0.235 $Wt^{0.822}$, weight in grams.	1.14
Ingestion Rate for Water (IRw) (L/day)	Water ingestion rate was calculated using the allometric equation for all mammals (USEPA 1993): Water Intake L/day = 0.099 $Wt^{0.90}$, weight in kilograms.	0.47
Ingestion Rate for Soil (IRs) (as % of diet)	The estimated percent soil in diet (in dry weight) for raccoons is 9.4%.	9.40%
Home Range (ha)	Mean home range sizes range from 39 to 2,560 ha (USEPA 1993). Average of mean home range sizes is 630 ha.	630
Area Use Factor (AUF) (unitless)	The AUF is the ratio of the site area to the home range, not to exceed a maximum value of 1. Site areas: Operations Area (105 ha); Eco DU-1 (53.7 ha); Eco DU-2 (20.7 ha); Eco DU-3 (3.44 ha); Parcel E (3.48 ha).	Operations Area: 0.17 Eco DU-1: 0.085 Eco DU-2: 0.033 Eco DU-1: 0.0055 Parcel E: 0.0055
Exposure Frequency	Racoons are year-round residents at the site.	EF=1

Notes:
AUF = Area Use Factor
BW = Body weight
EF = Exposure frequency
g = Gram
ha = Hectare
IRf = Ingestion rate for food
IRs = Ingestion rate for soil
IRw = Ingestion rate for water

TABLE H-2h: Mourning Dove Exposure Parameters
Nevada Environmental Response Trust Site
Henderson, Nevada

Exposure Parameter	Description	Values Selected for Exposure and Risk Calculations
Mourning Dove	Order: Columbiformes Family: Columbidae Species: *Zenaida macroura*	
Body Weight (BW) (kg)	The average mean range of mourning doves ranged from 99.3-114.6 grams for those in New Mexico (USACHPPM 2004). The average of 0.107 kilograms was used.	0.107
Dietary Makeup	Diet consists mostly of seeds although incidental ingestion of animal matter, mainly snails, and green forage may occur (USACHPPM 2004).	100% Plants
Ingestion Rate for Food (IRf) (kg ww/day)	A range for the food consumption rate of 7 to 17 grams wet food per day (or 0.007 to 0.017 kilogram wet food per day) was estimated for the mourning dove. In general, daily food intake equals about 16 percent of the body mass though it fluctuates during different seasons (USACHPPM 2004). The average (0.012 kg ww/day) of the two food ingestion values was used.	0.012
Ingestion Rate for Water (IRw) (L/day)	Water ingestion rates were calculated using the allometric equation for water intake for all birds (USEPA 1993): Water Intake (L/day) = 0.059 $Wt^{0.67}$, where Wt is in kilograms.	0.013
Ingestion Rate for Soil (IRs) (as % of diet)	No information on soil ingestion was found in the literature. Beyer et al. (1994, as cited in USACHPPM 2004) reported soil ingestion of 9.3 percent of diet for wild turkeys. Because mourning doves also forage on the ground, it is assumed that mourning doves would have a comparable soil ingestion to that of wild turkeys. However, it should be noted that 9.3 percent is likely an upperbound value and therefore, its use would be very conservative (USACHPPM 2004).	9.3%
Home Range (ha)	In Missouri, adult mourning doves had feeding and resting areas located considerable distances from nest sites , with males ranging 1 - 8 km from the nest daily. Females sometimes seen as far as 5 km from nest. In Idaho, maximum distances traveled from feeding and loafing sites to nests averaged 4 km (USACHPPM 2004). Home range in hectares was calculated using a radius of 4.467 km (average kilometer of home ranges), assuming a circular home range, and converted to hectares.	6,265
Area Use Factor (AUF) (unitless)	The AUF is the ratio of the site area to the home range, not to exceed a maximum value of 1. Site areas: Operations Area (105 ha); Eco DU-1 (53.7 ha); Eco DU-2 (20.7 ha); Eco DU-3 (3.44 ha); Parcel E (3.48 ha).	Operations Area: 0.017 Eco DU-1: 0.0086 Eco DU-2: 0.0033 Eco DU-1: 0.00055 Parcel E: 0.00056
Exposure Frequency	Specific habitats used during migration not well studied but do not appear to differ markedly from those used at other times of year. Habitat quality is determined primarily by food availability and roosting and loafing cover. Assumed to be non-migratory.	EF=1

Notes:
AUF = Area Use Factor
BW = Body weight
EF = Exposure frequency
g = Gram
ha = Hectare
IRf = Ingestion rate for food
IRs = Ingestion rate for soil

TABLE H-2i: Great Basin Pocket Mouse Exposure Parameters
Nevada Environmental Response Trust Site
Henderson, Nevada

Exposure Parameter	Description	Values Selected for Exposure and Risk Calculations
Great Basin Pocket Mouse	Order: Rodentia Family: Heteromyidae Species: *Perognathus parvus*	
Body Weight (BW) (kg)	The mean adult body weight in Nevada range is 25.4 g (males) and 20.5 g (females) (ORNL 1997). The mean of of 22.95 grams was used.	0.02295
Dietary Makeup	The diet of pocket mice consist primarily of seeds, although insects may be consumed in spring before seeds become available (ORNL 1997).	10% Invertebrates 90% Plant Material
Ingestion Rate for Food (IRf) (kg ww/day)	Food ingestion rates were calculated using the allometric equation for rodents (USEPA 1993): Food Intake g/day = 0.621 $Wt^{0.564}$, with weight in grams.	0.004
Ingestion Rate for Water (IRw) (L/day)	Pocket mice generally do not require water other than that contained in their food (ORNL 1997).	0
Ingestion Rate for Soil (IRs) (as % of diet)	Specific soil ingestion data was not readily available for the Great Basin pocket mouse. Soil ingestion by burrowing rodents is typically < 2% to 7.7% (ORNL 1997). The average value of this was used for the pocket mouse.	4.85%
Home Range (ha)	Home range size in New Mexico ranged from 0.44 to 2.24 ha (ORNL 1997). The average home range for the pocket mouse was used.	1.09
Area Use Factor (AUF) (unitless)	The AUF is the ratio of the site area to the home range, not to exceed a maximum value of 1. Mice are assumed to forage exclusively on the site.	AUF=1 (all areas)
Exposure Frequency	Pocket mice are year-round residents at the site.	EF=1

TABLE I-1a: Potential Daily Dose and Hazard Quotients for Coopers Hawk: Operations Area
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NA = Not applicable
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

TABLE I-1b: Potential Daily Dose and Hazard Quotients for Kit Fox: Operations Area
Nevada Environmental Response Trust Site
Henderson, Nevada

TABLE I-1b: Potential Daily Dose and Hazard Quotients for Kit Fox: Operations Area
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NA = Not applicable
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

TABLE I-1c: Potential Daily Dose and Hazard Quotients for Western Burrowing Owl: Operations Area
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

TABLE I-1d: Potential Daily Dose and Hazard Quotients for American Robin: Operations Area
Nevada Environmental Response Trust Site
Henderson, Nevada

TABLE I-1d: Potential Daily Dose and Hazard Quotients for American Robin: Operations Area
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

TABLE I-1e: Potential Daily Dose and Hazard Quotients for Desert Shrew: Operations Area
Nevada Environmental Response Trust Site
Henderson, Nevada

TABLE I-1e: Potential Daily Dose and Hazard Quotients for Desert Shrew: Operations Area
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100
500	100 < HQ

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

TABLE I-1f: Potential Daily Dose and Hazard Quotients for Fringed Myotis: Operations Area
Nevada Environmental Response Trust Site
Henderson, Nevada

TABLE I-1f: Potential Daily Dose and Hazard Quotients for Fringed Myotis: Operations Area
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100
500	100 < HQ

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

TABLE I-1g: Potential Daily Dose and Hazard Quotients for Raccoon: Operations Area
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

TABLE I-1h : Potential Daily Dose and Hazard Quotients for Mourning Dove: Operations Area
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

TABLE I-1i: Potential Daily Dose and Hazard Quotients for Great Basin Pocket Mouse: Operations Area
Nevada Environmental Response Trust Site
Henderson, Nevada

TABLE I-1i: Potential Daily Dose and Hazard Quotients for Great Basin Pocket Mouse: Operations Area
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

TABLE I-2a: Potential Daily Dose and Hazard Quotients for Coopers Hawk: Eco DU-1
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NA = Not applicable
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

TABLE I-2b: Potential Daily Dose and Hazard Quotients for Kit Fox: Eco DU-1
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NA = Not applicable
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

TABLE I-2c: Potential Daily Dose and Hazard Quotients for Western Burrowing Owl: Eco DU-1
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

TABLE I-2d: Potential Daily Dose and Hazard Quotients for American Robin: Eco DU-1
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

TABLE I-2e: Potential Daily Dose and Hazard Quotients for Desert Shrew: Eco DU-1
Nevada Environmental Response Trust Site
Henderson, Nevada

TABLE I-2e: Potential Daily Dose and Hazard Quotients for Desert Shrew: Eco DU-1
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100
500	100 < HQ

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

TABLE I-2f: Potential Daily Dose and Hazard Quotients for Fringed Myotis: Eco DU-1

TABLE I-2f: Potential Daily Dose and Hazard Quotients for Fringed Myotis: Eco DU-1
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100
500	100 < HQ

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

TABLE I-2g: Potential Daily Dose and Hazard Quotients for Raccoon: Eco DU-1
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

TABLE I-2h : Potential Daily Dose and Hazard Quotients for Mourning Dove: Eco DU-1
Nevada Environmental Response Trust Site
Henderson, Nevada

TABLE I-2h : Potential Daily Dose and Hazard Quotients for Mourning Dove: Eco DU-1
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

TABLE I-2i: Potential Daily Dose and Hazard Quotients for Great Basin Pocket Mouse: Eco DU-1
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NA = Not applicable
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

TABLE I-3b: Potential Daily Dose and Hazard Quotients for Kit Fox: Eco DU-2

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NA = Not applicable
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level

mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100
500	100 < HQ

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100
500	100 < HQ

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

TABLE I-4a: Potential Daily Dose and Hazard Quotients for Coopers Hawk: Eco DU-3

Nevada Environmental Response Trust Site

Henderson, Nevada

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NA = Not applicable
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.
(e) Background data not available for retained constituents.

HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NA = Not applicable
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.
(e) Background data not available for retained constituents.

TABLE I-4c: Potential Daily Dose and Hazard Quotients for Western Burrowing Owl: Eco DU-3
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.
(e) Background data not available for retained constituents.

TABLE I-4d: Potential Daily Dose and Hazard Quotients for American Robin: Eco DU-3

Nevada Environmental Response Trust Site

Henderson, Nevada

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.
(e) Background data not available for retained constituents.

TABLE I-4f: Potential Daily Dose and Hazard Quotients for Fringed Myotis: Eco DU-3
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100
500	100 < HQ

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.
(e) Background data not available for retained constituents.

TABLE I-4g: Potential Daily Dose and Hazard Quotients for Raccoon: Eco DU-3
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.
(e) Background data not available for retained constituents.

TABLE I-4i: Potential Daily Dose and Hazard Quotients for Great Basin Pocket Mouse: Eco DU-3
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.
(e) Background data not available for retained constituents.

TABLE I-5a: Potential Daily Dose and Hazard Quotients for Coopers Hawk: Parcel E

Nevada Environmental Response Trust Site

Henderson, Nevada

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NA = Not applicable
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

TABLE I-5c: Potential Daily Dose and Hazard Quotients for Western Burrowing Owl: Parcel E
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

TABLE I-5e: Potential Daily Dose and Hazard Quotients for Desert Shrew: Parcel E

Nevada Environmental Response Trust Site

Henderson, Nevada

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100
500	100 < HQ

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

TABLE I-5g: Potential Daily Dose and Hazard Quotients for Raccoon: Parcel E
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

TABLE I-5i: Potential Daily Dose and Hazard Quotients for Great Basin Pocket Mouse: Parcel E
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:

% = Percent
AUF = Area use factor
BHC = Benzene hexachloride
BKG = Background
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = DDT and isomers
DL = Detection limit
HQ = Hazard quotient
Inverts = Invertebrates
LOAEL = Lowest observed apparent effects level
mg/kg = Milligrams per kilogram
mg/kg ww = Milligram per kilogram of wet weight
mg/kg-bw d = Milligrams per kilogram bodyweight per day
NC = No criterion
ND = Nondetects
NOAEL = No observed apparent effects level
OCPs = Organochlorine pesticides
PCB = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100

(a) Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.
(b) Invertebrates are assumed to be 16% solids. The dry weight is multiplied by 0.16 to convert to wet weight.
(c) Small mammals are assumed to be 32% solids. The dry weight concentration is multiplied by 0.32 to convert to wet weight.
(d) An AUF of 1 assumes that a receptor spends 100% of its time at the site. An AUF of less than 1 assumes that a receptor spends some portion of its time off-site based on a receptor's home range compared to the size of the site.

APPENDIX J
UNCERTAINTY ANALYSIS

J-1 Evaluation of Chemicals Detected Lacking ESVs

J-2 Evaluation of Sample Quantitation Limits for Chemicals Not Detected with ESVs

J-3 Summary of Chemicals Not Detected Lacking ESVs

J-4 Uncertainties Associated with Dioxin and Furan Bioaccumulation Factors for Soil Invertebrates

J-5 Uncertainties Associated with the use of ECOSAR for Soil Criteria

Notes:

-- = No value
DU = Ecological Decision Unit
Eco-SSL = Ecological soil screening level (USEPA 2007)
ESV = Ecological screening value
LANL = Los Alamos National Laboratory (LANL 2018)
mg/kg = Milligram per kilogram
R4 = USEPA Region 4 (USEPA R4 2018)
SQL or 1/2 SQL = Sample quantitation limit or one-half sample quantitation limit
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100
1000	100 < HQ

TABLE J-2b: Location-Specific Evaluation of Sample Quantitation Limits for Chemicals Not Detected with Ecological Screening Values: Parcel E
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:

DU = Ecological Decision Unit
Eco-SSL = Ecological soil screening level (USEPA 2007)
ESV = Ecological screening value
LANL = Los Alamos National Laboratory (LANL 2018)
mg/kg = Milligram per kilogram
ORNL = Oak Ridge National Laboratory
R4 = USEPA Region 4 (USEPA R4 2018)
SQL or 1/2 SQL = Sample quantitation limit or one-half sample quantitation limit
TRV = Toxicity reference value

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100
1000	100 < HQ

LANL 2020: N3B (Newport News Nuclear BWXT-Los Alamos, LLC), November 2020. "ECORISK Database (Release 4.2)," on CD, Newport News Nuclear BWXT-Los Alamos, LLC, document EM2020-0575, Los Alamos, New Mexico.

USEPA 2007: USEPA. 2007. Ecological Soil Screening Levels. http://www.epa.gov/oswer/riskassessment/ecorisk/ecossl.htm.

USEPA 2018: USEPA Region 4. 2018. "Region 4 Ecological Risk Assessment Supplemental Guidance". March.

ORNL ESVs are from Efroymson, R.A. , M.E. Will, and G.W. Suter II. 1997b. Toxicological Benchmarks for Contaminants of Potential Concern for Effects on Soil and Litter Invertebrates and Heterotrophic Process: 1997 Revision. Oak Ridge National Laboratory, Oak Ridge, TN. ES/ER/TM-126/R2. (Available at http://www.esd.ornl.gov/programs/ecorisk/documents/tm126r21.pdf)

TABLE J-2g: Uncertainties Regarding Chemicals Not Detected with SQLs Greater than ESVs: Operations Area
Nevada Environmental Response Trust Site
Henderson, Nevada

Chemical Group	Chemical Name	Spatial Plot Evaluation			Summary	Overall Observations and Conclusions
		General Spatial Observations	Are Sampling locations for this Chemical Group the Same? Highest density Areas (i.e. Debris Pile)? Are any hotspots apparent?	Spatial Relationship to Perchlorate?		
General Chemistry	Cyanide (total)	Fairly well distributed sampling scheme but no samples in Parcel E and no higher density sampling at the Debris Pile. No hotspots or clustering of samples where highest SQL/ESV ratios are apparent.	Cyanide is the only chemcial with SQL>ESV in the General Chemistry category. No samples taken in Parcel E. Most samples taken in Eco DU-1 but no focus on Debris Pile. Six samples were taken in close proximity in Eco DU-2 just north of former Parcel H.	SA11-0.5D: Perchlorate HQ = 600. Perchlorate dilution factor = 100. SA12-0.5: Perchlorate HQ = 50. Perchlorate dilution factor = 10.	Max HQ of 6 is not cause for concern. Max HQ @ Max dilution. High # of SQLs>ESVs (96%) - Significant ESV Basis: LANL OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	Contribution to risk is not expected to be significant based low HQs. Also, cyanide was eliminated from further evaluation in the OU-1 RI. Dilution is not a factor for the SQL to ESV exceedances.
OCPs	Toxaphene	No apparent clustering or hot spots. Sampling locations are well distributed throughout Eco DU-1. Less so in Eco DU-2 and Eco DU-3.	Yes. Highest density of samples, including samples w/ SQLs>ESVs, is the Debris Pile. No apparent hotspots.	Location with highest HQ is not related to Perchlorate locations with high HQ. No perchlorate sampled at this location.	Max HQ of 10,000 is cause for additional evaluation; 100x dilution may be contributing factor. Max HQ @ Max dilution. High # of SQLs>ESVs (100%): significant ESV Basis: ECOSAR OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	Contribution to risk cannot be ruled out given the high SQLs compared to ESVs and the high SQL>ESV frequency. However, toxaphene was eliminated form further evaluation in the OU-1 RI and the dilution may contribute to the high SSQL to ESV exceedances.
OCPs	Heptachlor epoxide	Well distributed sampling scheme. No hotspots or clustering of samples at highest SQL/ESV ratios.	Yes. Highest density of samples w/ SQLs>ESVs is the debris pile but Debris Pile does not contain the highest ratios. No apparent hotspots.	Locations with highest HQ is not related to Perchlorate locations with high HQ. Perchlorate HQ at location RSAK4009-0.5B = 6. Perchlorate not sampled at SSAM3-01-BPC.	Max HQ of 300 is cause for additional evaluation; 100x dilution may be contributing factor. Max HQ @ Max dilution. High # of SQLs>ESVs (91%): significant ESV Basis: ECOSAR OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	Contribution to risk cannot be ruled out given the high SQLs compared to ESVs and the high SQL>ESV frequency. However, Heptachlor epoxide was eliminated form further evaluation in the OU-1 RI and the high dilution may contribute to the high SQL/ESV HQ.
OCPs	Endosulfan sulfate	Well distributed sampling scheme. No hotspots or clustering of samples at highest SQL/ESV ratios.	Yes. Highest density of samples w/ SQLs>ESVs is the Debris Pile but debris pile does not contain the highest ratios. No apparent hotspots.	Locations with highest HQ is not related to Perchlorate locations with high HQ. Perchlorate HQ at location RSAK4009-0.5B = 6.	Max HQ of 100 is cause for additional evaluation; 50x dilution may be contributing factor however, HQ @ Max dilution (100x) is 40 compared to 100 High # of SQLs>ESVs (79%) - significant ESV Basis: ECOSAR OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	Contribution to risk cannot be ruled out given the high SQLs compared to ESVs and the high SQL>ESV frequency. However, endosulfan sulfate was eliminated from further evaluation in the OU-1 RI and the high dilution may contribute to the high SQL to ESV exceedances.
OCPs	Chlordane (total)	Sample locations are well distributed in Eco DU-1 but less well represented in Eco DU-2 and Eco DU-3. Not analyzed in Parcel E. No pattern of hot spots or clustering of samples where SQL/ESV ratios are highest is apparent.	No (No samples in Parcel E; limited sampling at Debris Pile). There are no higher density sampling areas for this constituent. No apparent hotspots.	Locations with highest HQ is not related to Perchlorate locations with high HQ. Perchlorate HQ at location RSAK4009-0.5B = 6.	Max HQ of 80 is cause for additional evaluation; 50x dilution may be contributing factor however, HQ @ Max dilution (100x) is 8 compared to 80 High # of SQLs>ESVs (69%) - significant ESV Basis: ECOSAR OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	Contribution to risk cannot be ruled out given the high SQLs compared to ESVs and the high SQL>ESV frequency. However, chlordane (total) was eliminated from further evaluation in the OU-1 RI and the high dilution may contribute to the high SQL to ESV exceedances.
OCPs	Endrin aldehyde	Sample locations are well distributed in Eco DU-1 but less well represented in Eco DU-2 and Eco DU-3. No pattern of hot spots or clustering of samples where SQL/ESV ratios are highest is apparent.	Yes. Highest density of samples w/ SQLs>ESVs is the Debris Pile but debris pile does not contain the highest ratios. No apparent hotspots.	Locations with highest HQ is not related to Perchlorate locations with high HQ. Perchlorate HQ at location RSAK4009-0.5B = 6.	Max HQ of 60 is cause for additional evaluation; 50x dilution may be contributing factor however, HQ @ Max dilution (100x) is 10 compared to 60 High # of SQLs>ESVs (21%) - moderately significant ESV Basis: USEPA Region 4 OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	Contribution to risk cannot be ruled out given the high SQLs compared to ESVs and the high SQL>ESV frequency. However, endrin aldehyde was eliminated from further evaluation in the OU-1 RI and the high dilution may contribute to the high SQL to ESV exceedances.

TABLE J-2g: Uncertainties Regarding Chemicals Not Detected with SQLs Greater than ESVs: Operations Area

Henderson, Nevada

Chemical Group	Chemical Name	Spatial Plot Evaluation			Summary	Overall Observations and Conclusions
		General Spatial Observations	Are Sampling locations for this Chemical Group the Same? Highest density Areas (i.e. Debris Pile)? Are any hotspots apparent?	Spatial Relationship to Perchlorate?		
OCPs	Endosulfan I	Sample locations are well distributed in Eco DU-1 but less well represented in Eco DU-2 and Eco DU-3. No pattern of hot spots or clustering of samples where SQL/ESV ratios are highest is apparent.	Yes. Highest density of samples w/ SQLs>ESVs is the Debris Pile but debris pile does not contain the highest ratios. No apparent hotspots.	Locations with highest HQ is not related to Perchlorate locations with high HQ. Perchlorate HQ at location RSAK4009-0.5B = 6.	Max HQ of 50 is cause for additional evaluation; 50x dilution may be contributing factor however, HQ @ Max dilution (100x) is 20 compared to 50 High # of SQLs>ESVs (56%) - moderately significant ESV Basis: ECOSAR OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	Contribution to risk cannot be ruled out given the high SQLs compared to ESVs and the high SQL>ESV frequency. However, endosulfan 1 was eliminated from further evaluation in the OU-1 RI and the high dilution may contribute to the high SQL to ESV exceedances.
OCPs	Heptachlor	Sample locations are well distributed in Eco DU-1 but less well represented in Eco DU-2 and Eco DU-3. No pattern of hot spots or clustering of samples where SQL/ESV ratios are highest is apparent.	Yes. Highest density of samples w/ SQLs>ESVs is the Debris Pile but debris pile does not contain the highest ratios. No apparent hotspots.	Locations with highest HQ is not related to Perchlorate locations with high HQ. Perchlorate HQ at location RSAK4009-0.5B = 6.	Max HQ of 30 is cause for additional evaluation; 80x dilution may be contributing factor however, HQ @ Max dilution (100x) is 20 compared to 30 Moderate # of SQLs>ESVs (20%) - moderately significant ESV Basis: ECOSAR OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	Contribution to risk is not expected to be significant based on low SQL>ESV frequency and lower HQs. Also, heptachlor was eliminated from further evaluation in the OU-1 RI. The high dilution may contribute to the SQL to ESV exceedances.
OCPs	alpha-Chlordane	Sample locations are well distributed in Eco DU-1 but less well represented in Eco DU-2 and Eco DU-3. No pattern of hot spots or clustering of samples where SQL/ESV ratios are highest is apparent.	Yes. Highest density of samples w/ SQLs>ESVs is the Debris Pile but debris pile does not contain the highest ratios. No apparent hotspots.	Locations with highest HQ is not related to Perchlorate locations with high HQ. Perchlorate HQ at location RSAK4009-0.5B = 6.	Max HQ of 20 is cause for additional evaluation; 50x dilution may be contributing factor however, HQ @ Max dilution (100x) is 10 compared to 20 Low # of SQLs>ESVs (19%) - moderately significant ESV Basis: ECOSAR OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	Contribution to risk is not expected to be significant based on low SQL>ESV frequency and lower HQs. Also, alpha-chlordane was eliminated from further evaluation in the OU-1 RI. The high dilution may contribute to the SQL to ESV exceedances.
OCPs	gamma-BHC	Sample locations are well distributed in Eco DU-1 but less well represented in Eco DU-2 and Eco DU-3. Same sampling locations for all OCPs. No pattern of hot spots or clustering of samples where SQL/ESV ratios are highest is apparent.	Yes. Highest density of samples w/ SQLs>ESVs is the Debris Pile but debris pile does not contain the highest ratios. No apparent hotspots.	Locations with highest HQ is not related to Perchlorate locations with high HQ. Perchlorate not sampled at SSAM3-01-BPC.	Max HQ of 20 is cause for additional evaluation; 100x dilution may be contributing factor however, Max HQ @ Max dilution Low # of SQLs>ESVs (18%) - moderately significant ESV Basis: ECOSAR OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	Contribution to risk is not expected to be significant based on low SQL>ESV frequency and lower HQs. Also, alpha-chlordane was eliminated from further evaluation in the OU-1 RI. The high dilution may contribute to the SQL to ESV exceedances.
OCPs	Dieldrin	Sample locations are well distributed in Eco DU-1 but less well represented in Eco DU-2 and Eco DU-3. Same sampling locations for all OCPs. No pattern of hot spots or clustering of samples where SQL/ESV ratios are highest is apparent.	Yes. Highest density of samples w/ SQLs>ESVs is the Debris Pile but debris pile does not contain the highest ratios. No apparent hotspots.	Locations with highest HQ is not related to Perchlorate locations with high HQ. Perchlorate HQ at location RSAK4009-0.5B = 6.	Max HQ of 20 is cause for additional evaluation; 50x dilution may be contributing factor however, Max HQ @ Max dilution (100x) is 5 compared to 20 Low # of SQLs>ESVs (16%) - moderately significant ESV Basis: Eco SSL OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	Contribution to risk is not expected to be significant based on low SQL>ESV frequency and lower HQs. Also, dieldrin was eliminated from further evaluation in the OU-1 RI. The high dilution may contribute to the SQL to ESV exceedances.

TABLE J-2g: Uncertainties Regarding Chemicals Not Detected with SQLs Greater than ESVs: Operations Area
Nevada Environmental Response Trust Site
Henderson, Nevada

Chemical Group	Chemical Name	Spatial Plot Evaluation			Summary	Overall Observations and Conclusions
		General Spatial Observations	Are Sampling locations for this Chemical Group the Same? Highest density Areas (i.e. Debris Pile)? Are any hotspots apparent?	Spatial Relationship to Perchlorate?		
OPPs	Malathion	Sample locations are generally well distributed but mostly in Eco DU-1 and Parcel E.	Yes. However, fewer sample locations for OPPs than OCPs. Highest density of samples w/ SQLs>ESVs is the Debris Pile but Debris Pile does not contain the highest ratios. No apparent hotspots.	Locations with highest HQ is not related to Perchlorate locations with high HQ or with perchlorate dilutions (perchlorate dilution factor = 1). Perchlorate HQ = 1.	Max HQ of 500 is cause for additional evaluation; dilution not a contributing factor. Max HQ @ Max dilution High # of SQLs>ESVs (100%) - significant ESV Basis: ECOSAR OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	Contribution to risk cannot be ruled out given the high SQLs compared to ESVs and the high SQL>ESV frequency. However, malathion was eliminated from further evaluation in the OU-1 RI. Dilution is not a factor for any of the OPPs.
OPPs	Atrazine	Very limited and clustered sampling scheme. Only sampled on East side of Eco DU-1 and in Parcel E.	No. Highest density is Debris Pile. Fewer overall samples than other OPPs.	No indication of a relationship between high SQL/ESV ratios for atrazine and high HQs for perchlorate.	Max HQ of 300 is cause for additional evaluation; dilution not a contributing factor. Max HQ @ Max dilution High # of SQLs>ESVs (100%) - significant ESV Basis: ECOSAR OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	Contribution to risk cannot be ruled out given the high SQLs compared to ESVs and the high SQL>ESV frequency. However, atrazine was eliminated from further evaluation in the OU-1 RI. Dilution is not a factor for any of the OPPs.
OPPs	Guthion	Fairly well distributed sampling scheme. Parcel E and East side of Eco DU-1 sample locations.	Yes. However, fewer sample locations for OPPs than OCPs. Highest density of samples w/ SQLs>ESVs is the Debris Pile but Debris Pile does not contain the highest ratios. No apparent hotspots.	SA11-0.5D: Perchlorate HQ = 600. Perchlorate dilution factor = 100. SA20-0.5D: Perchlorate HQ = 1. Perchlorate dilution factor = 1.	Max HQ of 300 is cause for additional evaluation; dilution not a contributing factor. Max HQ @ Max dilution High # of SQLs>ESVs (100%) - significant ESV Basis: ECOSAR OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	Contribution to risk cannot be ruled out given the high SQLs compared to ESVs and the high SQL>ESV frequency. However, guthion was eliminated from further evaluation in the OU-1 RI. Dilution is not a factor for any of the OPPs.
OPPs	Parathion	Well distributed sampling scheme but sampling is not extensive. No hotspots or clustering of samples where highest SQL/ESV ratios are apparent.	Yes. However, fewer sample locations for OPPs than OCPs. Highest density of samples w/ SQLs>ESVs is the Debris Pile but Debris Pile does not contain the highest ratios. No apparent hotspots.	No indication of a relationship between high SQL/ESV ratios for parathion and high HQs for perchlorate.	Max HQ of 100 is cause for additional evaluation; dilution not a contributing factor. High # of SQLs>ESVs (100%) - significant ESV Basis: ECOSAR OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	Contribution to risk cannot be ruled out given the high SQLs compared to ESVs and the high SQL>ESV frequency. However, parathion was eliminated from further evaluation in the OU-1 RI. Dilution is not a factor for any of the OPPs.
OPPs	Chlorpyrifos	Well distributed sampling scheme but sampling is not extensive. No hotspots or clustering of samples where highest SQL/ESV ratios are apparent.	Yes. However, fewer sample locations for OPPs than OCPs. Highest density of samples w/ SQLs>ESVs is the Debris Pile but Debris Pile does not contain the highest ratios. No apparent hotspots.	SA11-0.5D: Perchlorate HQ = 600. Perchlorate dilution factor = 100. SA20-0.5D: Perchlorate HQ = 1. Perchlorate dilution factor = 1.	Max HQ of 8 is not cause for concern; dilution not a contributing factor. High # of SQLs>ESVs (100%) - significant ESV Basis: ECOSAR OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	Contribution to risk is not expected to be significant based on low HQs. Also, chlorpyrifos was eliminated from further evaluation in the OU-1 RI. Dilution is not a factor for any of the OPPs.
OPPs	Diazinon	Well distributed sampling scheme but sampling is not extensive. No hotspots or clustering of samples where highest SQL/ESV ratios are apparent.	Yes. However, fewer sample locations for OPPs than OCPs. Highest density of samples w/ SQLs>ESVs is the Debris Pile but Debris Pile does not contain the highest ratios. No apparent hotspots.	SA11-0.5D: Perchlorate HQ = 600. Perchlorate dilution factor = 100. SA20-0.5D: Perchlorate HQ = 1. Perchlorate dilution factor = 1.	Max HQ of 7 is not cause for concern; dilution not a contributing factor. High # of SQLs>ESVs (100%) - significant ESV Basis: ECOSAR OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	Contribution to risk is not expected to be significant based on low HQs. Also, diazinon was eliminated from further evaluation in the OU-1 RI. Dilution is not a factor for any of the OPPs.

Nevada Environmental Response Trust Site
Henderson, Nevada

Chemical Group	Chemical Name	Spatial Plot Evaluation			Summary	Overall Observations and Conclusions
		General Spatial Observations	Are Sampling locations for this Chemical Group the Same? Highest density Areas (i.e. Debris Pile)? Are any hotspots apparent?	Spatial Relationship to Perchlorate?		
OPPs	Simazine	ted sampling. Samples collected at debris pile and P	No. Focus is Debris Pile and Parcel E (fewer samples than other OPPs). No apparent hotspots.	No indication of a relationship between high SQL/ESV ratios for simazine and high HQs for perchlorate.	Max HQ of 3 is not cause for concern; dilution not a contributing factor. High # of SQLs>ESVs (100%) - significant ESV Basis: ECOSAR OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	Contribution to risk is not expected to be significant based on low HQs. Also, simazine was eliminated from further evaluation in the OU-1 RI. Dilution is not a factor for any of the OPPs.
SVOCs	Hexachloro-cyclopentadiene (c)	Small sample size. Sample locations are clustered/poorly distributed. Samples are focused in Eco DU-1, Parcel E and just south of Parcel G.	Yes. However, fewer sample locations than that for OPPs than OCPs. Highest density of samples w/ SQLs>ESVs is the Debris Pile. Debris Pile contains the highest SQL/ESV HQ. No apparent hotspots given the poor distribution of sample locations.	Perchlorate sample ID at this location is RIT-3-05. Perchlorate HQ = 60. Perchlorate dilution factor = 100.	Max HQ of 4,000 is cause for additional evaluation; dilution may be a contributing factor, however, Max HQ @ Max dilution is 500 compared to 4,000 High # of SQLs>ESVs (100%) - significant ESV Basis: ECOSAR OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	Contribution to risk cannot be ruled out given the high SQLs compared to ESVs and high SQL>ESV frequency. However, hexachlorocyclopentadiene was eliminated from further evaluation in the OU-1 RI. Dilution is not likely a significant factor.
SVOCs	Benzyl alcohol (a)	Small sample size. Sample locations are clustered/poorly distributed. Samples are focused in Eco DU-1, Parcel E and just south of Parcel G.	Yes. However, fewer sample locations than that for OPPs than OCPs. Highest density of samples w/ SQLs>ESVs is the Debris Pile. Debris Pile contains the highest SQL/ESV HQ. No apparent hotspots given the poor distribution of sample locations.	Perchlorate sample ID at this location is RIT-3-05. Perchlorate HQ = 60. Perchlorate dilution factor = 100.	Max HQ of 2,000 is cause for additional evaluation; 4x dilution may be contributing factor however, Max HQ @ Max dilution is 300 compared to 2000 High # of SQLs>ESVs (100%) - significant ESV Basis: ECOSAR OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	Contribution to risk cannot be ruled out given the high SQLs compared to ESVs and high SQL>ESV frequency. However, benzyl alcohol was eliminated from further evaluation in the OU-1 RI. Dilution is not likely a significant factor.
SVOCs	Benzoic acid (a)	Small sample size. Sample locations are clustered/poorly distributed. Samples are focused in Eco DU-1, Parcel E and just south of Parcel G.	Yes. However, fewer sample locations than that for OPPs than OCPs. Highest density of samples w/ SQLs>ESVs is the Debris Pile. Debris Pile contains the highest SQL/ESV HQ. No apparent hotspots given the poor distribution of sample locations.	Perchlorate sample ID at this location is RIT-3-05. Perchlorate HQ = 60. Perchlorate dilution factor = 100.	Max HQ of 1,000 is cause for additional evaluation; 2x dilution may be contributing. Max HQ @ Max dilution. High # of SQLs>ESVs (100%) - significant ESV Basis: ECOSAR OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	Contribution to risk cannot be ruled out given the high SQLs compared to ESVs and high SQL>ESV frequency. However, benzoic acid was eliminated from further evaluation in the OU-1 RI. Dilution is not likely a significant factor.
SVOCs	2,4-Dinitrophenol (a)	Small sample size. Sample locations are clustered/poorly distributed. Samples are focused in Eco DU-1, Parcel E and just south of Parcel G.	Yes. However, fewer sample locations than that for OPPs than OCPs. Highest density of samples w/ SQLs>ESVs is the Debris Pile. Debris Pile contains the highest SQL/ESV HQ. No apparent hotspots given the poor distribution of sample locations.	Perchlorate sample ID at this location is RIT-3-05. Perchlorate HQ = 60. Perchlorate dilution factor = 100.	Max HQ of 200 is cause for additional evaluation; 2x dilution may be contributing. Max HQ @ Max dilution. High # of SQLs>ESVs (100%) - significant ESV Basis: USEPA Region 5 OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	Contribution to risk cannot be ruled out given the high SQLs compared to ESVs and high SQL>ESV frequency. However, 2,4-dinitrophenol was eliminated from further evaluation in the OU-1 RI. Dilution is not likely a significant factor.
SVOCs	3,3'-Dichlorobenzidine (a)	Small sample size. Sample locations are clustered/poorly distributed. Samples are focused in Eco DU-1, Parcel E and just south of Parcel G.	Yes. However, fewer sample locations than that for OPPs than OCPs. Highest density of samples w/ SQLs>ESVs is the Debris Pile. Debris Pile contains the highest SQL/ESV HQ. No apparent hotspots given the poor distribution of sample locations.	Perchlorate sample ID at this location is RIT-3-05. Perchlorate HQ = 60. Perchlorate dilution factor = 100.	Max HQ of 200 is cause for additional evaluation; 4x dilution may be contributing. Max HQ @ Max dilution. High # of SQLs>ESVs (85%) - significant ESV Basis: ECOSAR OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	Contribution to risk cannot be ruled out given the high SQLs compared to ESVs and high SQL>ESV frequency. However, 3,3'-dichlorobenzidine was eliminated from further evaluation in the OU-1 RI. Dilution is not likely a significant factor.

TABLE J-2g: Uncertainties Regarding Chemicals Not Detected with SQLs Greater than ESVs: Operations Area
Nevada Environmental Response Trust Site
Henderson, Nevada

Chemical Group	Chemical Name	Spatial Plot Evaluation			Summary	Overall Observations and Conclusions
		General Spatial Observations	Are Sampling locations for this Chemical Group the Same? Highest density Areas (i.e. Debris Pile)? Are any hotspots apparent?	Spatial Relationship to Perchlorate?		
SVOCs	Hexachloroethane (a)	Small sample size. Sample locations are clustered/poorly distributed. Samples are focused in Eco DU-1, Parcel E and just south of Parcel G.	Yes. However, fewer sample locations than that for OPPs than OCPs. Highest density of samples w/ SQLs>ESVs is the Debris Pile. Debris Pile contains the highest SQL/ESV HQ. No apparent hotspots given the poor distribution of sample locations.	Perchlorate sample ID at this location is RIT-3-05. Perchlorate HQ = 60. Perchlorate dilution factor = 100.	Max HQ of 200 is cause for additional evaluation; 4x dilution may be contributing, however, Max HQ @ Max dilution is 20 compared to 200 High # of SQLs>ESVs (85%) - significant ESV Basis: ECOSAR OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	Contribution to risk cannot be ruled out given the high SQLs compared to ESVs and high SQL>ESV frequency. However, hexachloroethane was eliminated from further evaluation in the OU-1 RI. Dilution is not likely a significant factor.
SVOCs	2-Nitroaniline (a)	Small sample size. Sample locations are clustered/poorly distributed. Samples are focused in Eco DU-1, Parcel E and just south of Parcel G.	Yes. However, fewer sample locations than that for OPPs than OCPs. Highest density of samples w/ SQLs>ESVs is the Debris Pile. Debris Pile contains the highest SQL/ESV HQ. No apparent hotspots given the poor distribution of sample locations.	Perchlorate sample ID at this location is RIT-3-05. Perchlorate HQ = 60. Perchlorate dilution factor = 100.	Max HQ of 100 is cause for additional evaluation; 4x dilution may be contributing, however, Max HQ @ Max dilution is 10 compared to 100 High # of SQLs>ESVs (100%) - significant ESV Basis: ECOSAR OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	Contribution to risk cannot be ruled out given the high SQLs compared to ESVs and high SQL>ESV frequency. However, 2-nitroaniline was eliminated from further evaluation in the OU-1 RI. Dilution is not likely a significant factor.
SVOCs	2,4-Dimethylphenol (a)	Small sample size. Sample locations are clustered/poorly distributed. Samples are focused in Eco DU-1, Parcel E and just south of Parcel G.	Yes. However, fewer sample locations than that for OPPs than OCPs. Highest density of samples w/ SQLs>ESVs is the Debris Pile. Debris Pile contains the highest SQL/ESV HQ. No apparent hotspots given the poor distribution of sample locations.	Perchlorate sample ID at this location is RIT-3-05. Perchlorate HQ = 60. Perchlorate dilution factor = 100.	Max HQ of 100 is cause for additional evaluation; dilution may be contributing, however, Max HQ @ Max dilution. High # of SQLs>ESVs (84%) - significant ESV Basis: ECOSAR OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	Contribution to risk cannot be ruled out given the high SQLs compared to ESVs and high SQL>ESV frequency. However, 2,4-dimethylphenol was eliminated from further evaluation in the OU-1 RI. Dilution is not likely a significant factor.
SVOCs	2,4-Dichlorophenol (a)	Small sample size. Sample locations are clustered/poorly distributed. Samples are focused in Eco DU-1, Parcel E and just south of Parcel G. Few samples have SQLs>ESVs.	Yes. However, fewer sample locations than that for OPPs than OCPs. Highest density of samples w/ SQLs>ESVs is the Debris Pile. Debris Pile contains the highest SQL/ESV HQ. No apparent hotspots given the poor distribution of sample locations.	Perchlorate sample ID at this location is RIT-3-05. Perchlorate HQ = 60. Perchlorate dilution factor = 100.	Max HQ of 40 is cause for additional evaluation. Max HQ @ Max dilution. High # of SQLs>ESVs (16%) - significant ESV Basis: ECOSAR OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	Contribution to risk is not expected to be significant based on lower frequency of SQLs exceeding ESVs and lower HQs. Also, 2,4-Dichlorophenol was eliminated from further evaluation in the OU-1 RI. Dilution is not likely a factor for any of the OPPs.
SVOCs	2-Methylphenol (a)	Small sample size. Sample locations are clustered/poorly distributed. Samples are focused in Eco DU-1, Parcel E and just south of Parcel G. Few samples have SQLs>ESVs.	Yes. However, fewer sample locations than that for OPPs than OCPs. Highest density of samples w/ SQLs>ESVs is the Debris Pile. Debris Pile contains the highest SQL/ESV HQ. No apparent hotspots given the poor distribution of sample locations.	Perchlorate sample ID at this location is RIT-3-05. Perchlorate HQ = 60. Perchlorate dilution factor = 100.	Max HQ of 20 is cause for additional evaluation. Max HQ @ Max dilution. High # of SQLs>ESVs (16%) - moderately significant ESV Basis: ECOSAR OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	Contribution to risk is not expected to be significant based on lower frequency of SQLs exceeding ESVs and lower HQs. Also, 2-methylphenol was eliminated from further evaluation in the OU-1 RI. Dilution is not likely a factor for any of the OPPs.
SVOCs	Pentachlorophenol	Small sample size. Sample locations are clustered/poorly distributed. Samples are focused in Eco DU-1, Parcel E and just south of Parcel G. Few samples have SQLs>ESVs.	Yes. However, fewer sample locations than that for OPPs than OCPs. Highest density of samples w/ SQLs>ESVs is the Debris Pile. Debris Pile contains the highest SQL/ESV HQ. No apparent hotspots given the poor distribution of sample locations.	Perchlorate sample ID at this location is RIT-3-05. Perchlorate HQ = 60. Perchlorate dilution factor = 100.	Max HQ of 5 is not cause for concern. Max HQ @ Max dilution. High # of SQLs>ESVs (4%) - low significance ESV Basis: Eco SSL OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	Contribution to risk is not expected to be significant based on lower frequency of SQLs exceeding ESVs and lower HQs. Also, pentachlorophenol was eliminated from further evaluation in the OU-1 RI. Dilution is not likely a factor for any of the OPPs.

TABLE J-2g: Uncertainties Regarding Chemicals Not Detected with SQLs Greater than ESVs: Operations Area
Nevada Environmental Response Trust Site
Henderson, Nevada

Chemical Group	Chemical Name	Spatial Plot Evaluation			Summary	Overall Observations and Conclusions
		General Spatial Observations	Are Sampling locations for this Chemical Group the Same? Highest density Areas (i.e. Debris Pile)? Are any hotspots apparent?	Spatial Relationship to Perchlorate?		
SVOCs	n-Nitrosodiphenylamine	Small sample size. Sample locations are clustered/poorly distributed. Samples are focused in Eco DU-1, Parcel E and just south of Parcel G. Few samples have SQLs>ESVs.	Yes. However, fewer sample locations than that for OPPs than OCPs. Highest density of samples w/ SQLs>ESVs is the Debris Pile. Debris Pile contains the highest SQL/ESV HQ. No apparent hotspots given the poor distribution of sample locations.	Perchlorate sample ID at this location is RIT-3-05. Perchlorate HQ = 60. Perchlorate dilution factor = 100.	Max HQ of 5 is not cause for concern. Max HQ @ Max dilution. High # of SQLs>ESVs (4%) - low significance ESV Basis: USEPA Region 5 OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	Contribution to risk is not expected to be significant based on lower frequency of SQLs exceeding ESVs and lower HQs. Also, n-nitrosodiphenylamine was eliminated from further evaluation in the OU-1 RI. Dilution is not likely a factor for any of the OPPs.
SVOCs	4-Chloroaniline	Small sample size. Sample locations are clustered/poorly distributed. Samples are focused in Eco DU-1, Parcel E and just south of Parcel G. Few samples have SQLs>ESVs.	Yes. However, fewer sample locations than that for OPPs than OCPs. Highest density of samples w/ SQLs>ESVs is the Debris Pile. Debris Pile contains the highest SQL/ESV HQ. No apparent hotspots given the poor distribution of sample locations.	Perchlorate sample ID at this location is RIT-3-05. Perchlorate HQ = 60. Perchlorate dilution factor = 100.	Max HQ of 4 is not cause for concern. Max HQ @ Max dilution. High # of SQLs>ESVs (4%) - low significance ESV Basis: LANL OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	Contribution to risk is not expected to be significant based on lower frequency of SQLs exceeding ESVs and lower HQs. Also, 4-chloroaniline was eliminated from further evaluation in the OU-1 RI. Dilution is not likely a factor for any of the OPPs.
VOCs	Ethylene glycol	ngle location on east side of Eco DU-2 just north of	Single sample. Not located at Debris Pile. Evaluation of hotspots not possible given sample size of 1.	Ethylene glycol - plot not placed on Portal. This sample ID is not shown on Portal.	Max HQ of 100 is cause for additional evaluation. Max HQ @ Max dilution. High # of SQLs>ESVs (100%) - high significance ESV Basis: ECOSAR OU-1 RI COPC: No Spatial Analysis: Nothing remarkable/No hotspots campared to key OU-1 RI COPCs	There was only a single sample analyzed so SQL/ESV HQ of 100 and exceedance frequency of 100% are not a factor.
General Chemistry	Bromomethane	Extensive sampling throughout OU-1 particularly in Eco DU-1. SQLs<ESVs at most locations.	No. Sampling locations for bromomethane and ethylene glycol are not the same as there is only a single sampling location for ethylene glycol. No hotspots or clustering of samples where highest SQL/ESV ratios are apparent. No apparent hotspots.	Many similar sampling locations to perchlorate but there are fewer locations for bromomethane and there are no bromomethane sample locations at the Debris Pile.	Max HQ of 6 is not cause for concern; dilution not a significant factor Low # of SQLs>ESVs (9%): Not significant ESV Basis: ECOSAR OU-1 RI Site COPC: No Spatial Analysis: Nothing remarkable	Contribution to risk is not expected to be significant based on lower frequency of SQLs exceeding ESVs and lower HQs. Also, 4-chloroaniline was eliminated from further evaluation in the OU-1 RI. Dilution is not likely a factor for any of the OPPs.

Notes:
(a) "No" = Excluded as a COPC in the OU-1/OU-2 RI as constituent concentrations are below leaching and human health screening levels.
(b) Eco SSL is the highest bounded NOAEL for mammals based on a 1970s rat study (Harr, J. R., Claeys, R. R., Bone, J. F., and Mccorcle, T. W. 1970. Dieldrin Toxidosis: Rat Reproduction. Am J Vet Res. 31(1): 181-9. Ref ID: 988). https://www.cabdirect.org/cabdirect/abstract/19701407788 OSU-Wistar lab rats, 28d old, fed dieldrin in diet. Measured lethality to adults and embryos, fertility, and dieldrin concentrations in tissue. Maximum dietary exposure to dieldrin consistent with normal reproduction was 0.014 ug/g bodyweight per day.

(c) Sample locations are clustered rather than randomly distributed. Only analyzed in northern Eco DU-1 and in cluster in Eco DU-2 south of Parcel G. The chemicals identifed for this footnote have exactly the same sample locations.
(d) Eco SSL is the lowest TRV for reproduction, growth, or survival from a 1980 chicken study (Stedman, Thomas M. Jr., Booth, Nicholas H., Bush, Parshall B., Page, Robert K., and Goetsch, Dennis D. 1980. Toxicity and bioaccumulation of pentachlorophenol in broiler chickens. Poult. Sci. 59(5): 1018-26. Ref ID. 6573.) https://pubmed.ncbi.nlm.nih.gov/7393838/.

1. INTRODUCTION

The uptake of 2,3,7,8-tetrachlorodibenzodioxin toxicity equivalents (TCDD TEQs) used in the OU-1 Refined Screening-Level Ecological Risk Assessment (OU-1 refined SLERA) for the Operable Unit 1 (OU-1) Refined SLERA Area is a value that is uncertain and therefore, this uncertainty assessment is provided in this appendix.

This appendix explores and describes the uncertainties around the uptake value used in the OU-1 refined SLERA and shows what the hazard quotients (HQs) would be if other bioaccumulation factors (BAFs) were used[1]. The majority of BAFs for uptake from soil to earthworms are based on models for highly exposed soil invertebrates, such as earthworms. Due to the habitat present at OU-1, earthworms are not likely to be the primary soil invertebrates eaten by soil invertebrate mammals and birds. The BAFs described in this appendix range over four orders of magnitude and affect the food web model provided in the OU-1 refined SLERA. This appendix provides an uncertainty analysis showing the influence of BAFs on the the estimated risks from dioxins and furans

The remainder of this appendix is organized as follows:

- Section 2.0 – Literature Uptake Factors
- Section 3.0 – The Effect of Invertebrate BAFs on the Food Web Model
- Section 4.0 – Uncertainties
- Section 5.0 – References

[1] Total organic carbon (TOC) concentrations were available for the Operations Area but were not available for Parcel E. As such, this uncertainty section focuses on the Operations Area of OU-1, but is also applicable to Parcel E.

2. LITERATURE UPTAKE FACTORS

2.1 Calculated Using Eco-SSL Guidance

The United States Environmental Protection Agency's Ecological Soil Screening Level (USEPA Eco-SSL) guidance document (USEPA 2007) develops a mathematical approximation for uptake factors of non-ionic organic constituents from soil into earthworms based on a series of equations that take into account the octanol-water partitioning coefficient (K_{ow}), the lipid fraction of the earthworms, the organic carbon content of the soil, and the soil organic carbon (total organic carbon or TOC) to water partitioning coefficient (K_{oc}). This means that the uptake of dioxins and furans (as well as other hydrophobic persistent organic pollutants) is governed by the balance between the organic carbon in the soil and the lipids of the receptor mediated by the amount of the constituent that can be dissolved in soil porewater.

The USEPA (2007) states:

$$C_{worm} = K_{ww} \times C_w \qquad \text{(Equation 1)}$$

Where:

C_{worm} = concentration in worm in miligrams per kilogram wet weight (mg/kg ww)

K_{ww} = biota to soil water partitioning coefficient in liters per kilogram wet weight tissue (L soil pore water/kg ww tissue)

C_w = concentration in soil pore water in miligrams per liter (mg/L)

Note that the Eco-SSL also includes a conversion to dry weight. As the food web model for this project was built using a wet-weight animal diet, that conversion is not needed here.

And K_{ww} is calculated from the following equation:

$$\text{Log}(K_{ww}) = 0.87 \times \text{Log}\ (K_{ow}) - 2 \qquad \text{(Equation 2)}$$

Where:

K_{ow} = octanol-water partitioning coefficient

The concentration of the constituent in soil pore water is calculated as:

$$C_w = \frac{C_s}{K_d} \qquad \text{(Equation 3)}$$

Where:

C_w = Concentration in soil porewater (mg/L)

C_s = Concentration in soil (mg/kg dry weight [dw] soil)

K_d = soil to water partitioning coefficient (L soil pore water/kg dw soil)

And:

$$K_d = f_{oc} \times K_{oc} \qquad \text{(Equation 4)}$$

Where

f_{oc} = fraction of organic carbon in soil (kg organic carbon/kg soil)

K_{oc} = soil organic carbon to water partitioning coefficient (L soil pore water/kg organic carbon)

Equations 1, 3, and 4 can be combined as:

$$C_{worm} = \frac{K_{ww} \times C_{soil}}{f_{oc} \times K_{oc}} \qquad \text{(Equation 5)}$$

Equation 5 can be rearranged to isolate C_{soil} so that the latter half of the equation functions as a BAF.

$$C_{worm} = C_{soil} \times \left(\frac{K_{ww}}{f_{oc} \times K_{oc}}\right) \qquad \text{(Equation 6)}$$

Equation 2 can then be rearranged to solve for K_{ww}:

$$K_{ww} = 10^{(0.87 \times \text{Log } (K_{ow}) - 2)} \qquad \text{(Equation 7)}$$

This mathematical approach is suitable for TCDD TEQs. The log(K_{ow}) for (TCDD) is 6.8 (USEPA 2000), so K_{ww} from Equation 7 can be calculated as follows:

$$K_{ww} = 10^{(0.87 \times 6.8 - 2)}$$

$$K_{ww} = 8{,}242$$

The soils in the Operations Area average 0.23% organic carbon, or a f_{oc} of 0.0023.

The K_{oc} for TCDD is 3.98×10^6 (USEPA, 2000).

Therefore, using Equation 4 and solving for K_d results in the following:

$$K_{d} = f_{oc} \times K_{oc}$$

$$K_d = 0.0023 \times \left(3.98 \times 10^6\right)$$

$$K_d = 9{,}154$$

Therefore, using Equation 6, and solving for C_{worm}:

$$C_{worm} = C_{soil} \times \left(\frac{K_{ww}}{f_{oc} \times K_{oc}}\right) \qquad \text{(Equation 8)}$$

$$C_{worm} = C_{soil} \times \left(\frac{8{,}242}{9{,}154}\right)$$

$$C_{worm} = C_{soil} \times 0.90$$

The site-specific uptake factor for dioxin and furan TEQs (as TCDD) is 0.90 times the concentration in soil, for wet weight earthworms based on the average concentration of TOC in the soil in the Operations Area.

Table J4-1 and Figure J4-1 show the TOC values in the Operations Area. They range from nondetects at a detection limit of 300 mg/kg to 15,800 mg/kg and the average is 2,315 mg/kg. This represents soil that has generally low TOC. Figure J4-2 shows the range of TEQ uptake values represented by these TOC values. The average value of 2,315 mg/kg may not be the best way to characterize the soil in the Operations Area. Table J4-2 and the

table below show the TEQ uptake values calculated for the average, 85th percentile, 95th percentile, 99th percentile, and maximum TOC values. This shows TEQ uptake values can vary across the Operations Area by a factor of nearly 7x just based on the soil TOC concentrations.

f_{oc} Value	Uptake Factor in Wet Weight
Average f_{oc} nondetects counted as ½ the detection limit (ND=0.5*DL)	0.90
85th percentile f_{oc} (ND=0.5*DL)	0.40
95th percentile f_{oc} (ND=0.5*DL)	0.24
99th percentile f_{oc} (ND=0.5*DL)	0.17
Maximum f_{oc}	0.13

2.2 USEPA Region 6

Another option for invertebrate TCDD uptake values is the USEPA's Region 6 compilation of uptake values (USEPA 1999). They suggest a BAF value of 1.59 (for wet weight earthworms) based on an average of two studies that contain a total of 5 different BAFs based on 20 day exposures. Four of those values are based on earthworms.

2.3 Earthworms Versus Terrestrial Insects

The uptake factors to this point have focused on earthworms. Earthworms are an ideal receptor to use for calculation of uptake values. They are relatively large terrestrial invertebrates that provide adequate tissue for analysis, they are easy to collect in the field, they have relatively high uptake values given their close contact with soil and relatively thin cuticle which produces conservatively high uptake values compared to other receptors, and they are ecologically important. However, since Nevada is part of the American desert "*the distribution and presence of earthworms will be closely associated with habitats that remain moist and protected from extreme temperature changes*" (Reynolds 2015). The on-Site soils are mostly sandy, dry, and compacted and provide little moisture and protection for earthworms (see photolog in Appendix B and Section 2.1.2 of the OU-1 Refined SLERA Report). Particularly, the surface of the OU-1 Site is primarily Quaternary alluvial deposits that slope north toward the Wash. The alluvium consists of a reddish-brown heterogeneous mixture of well-graded sand and gravel with lesser amounts of silt, clay, and caliche (Ramboll 2021). Clasts within the alluvium are primarily composed of volcanic material. Boulders and cobbles are common. Caliche (or hardpan) is essentially a type of naturally-occurring concrete where the particles of soil have been cemented together by mineral precipitation that is common in Nevada. This is not the type of soil where earthworms can flourish. Although they are a good, appropriately-conservative starting point, uptake factors for earthworms are not the most appropriate values for this Site.

2.4 Uptake Values for Insects From Literature

Table J4-3 shows uptake values from two studies (Young et al. 1987 and Kay et al. 2005) that specifically have soil and non-earthworm invertebrate concentrations of TCDD that can be used to calculate BAFs.

2.4.1 Calculation of TCDD Uptake Factors (Young et al. 1987)

There is a paucity of TCDD/TEQ uptake factors for terrestrial insects. An intensive field study in Florida measured TCDD in soil and TCDD in insects (Young et al. 1987). Soil concentrations of TCDD were measured in three areas, though the authors state "*most of the racerunners, snakes, toads and soil-borne insects were captured on Grid I*" (Young et al. 1987). TCDD concentrations in insects ranged from not detected in grasshoppers to 238 parts per trillion in beetle grubs. This data allows for calculation of TCDD uptake factors either based on the average soil concentration, or the Grid I soil concentration by dividing the animal concentration by the soil concentration (USEPA 2007 defines a BCF as a factor representing the ratio between the concentration in the food and the concentration in the soil) (as shown in Table J4-3 and the tables shown below). Grid I is of particular interest because that is where the author found the bulk of the insects.

Young 1987 Table 3	Number of Samples	Soil TCDD in Parts Per Trillion		
		Range	Median	Mean
Grid I	22	<10-1,500	110	325
Grid II	6	<10-470	30	115
Grid IV	26	<10-150	20	30
			Average	157

Young 1987 Table 7	Invertebrate TCDD in Parts Per Trillion	Calculated TCDD BAF Based on Average Concentration	Calculated TCDD BAF Based on Grid I Concentration
Grasshoppers	ND	--	--
Crickets (minimum)	18	0.11	0.06
Crickets (maximum)	26	0.17	0.08
Soil/Plant Insects	40	0.26	0.12
Burrow Spiders	115	0.73	0.35
Beetle Grubs	238	1.52	0.73
Average of Invertebrates		**0.56**	**0.27**

The author does not specify whether this value is in wet weight or dry weight. Assuming that the value is in wet weight is conservative because it leads to higher uptake values.

2.4.2 Calculation of TCDD Uptake Factors (Kay et al. 2005)

Kay et al. (2005) surveyed soil and wildlife concentrations of TCDD near the Tittabawassee River in Michigan. They have co-located soil concentrations and animal concentrations that allow for calculation of BAFs for the reference area and two study areas (Tittabawasse Township Park or TTP and Imerman Park or IP) (as shown in Table J4-3 and the following

table). The study areas have TCDD concentrations three orders of magnitude higher than the reference area. Because the soil concentrations are relatively similar at the TTP and IP sites, the table below also presents the average of the two sites. These are values for wet weight organisms, so no conversion is needed.

Kay 2005 Table 2	TCDD TEQ nanograms per kilogram (ng/kg) ww			Calculated BAF Based on Soil From		
	Reference Mean	TTP Location Mean	IP Location Mean	Reference Mean	TTP Location Mean	IP Location Mean
Soil	2.04	2,530	2,450	--	--	--
Depurated earthworms	0.612	83.5	76.1	0.30	0.033	0.031
Fresh earthworms	0.686	129	96.4	0.34	0.051	0.039
Terrestrial, non-earthworm invertebrates	1.13	15.8	28.7	0.55	0.0062	0.0120
Terrestrial, non-earthworm invertebrates average of TTP and IP Locations	1.13	22.25		0.55	0.009	

2.5 BAFs Also Vary With TEQ Concentration

The BAFs in both studies are strongly dependent on the concentration of TCDD in the soil. The areas with higher concentrations of TCDD have lower BAFs and the areas with lower concentrations of TCDD have higher BAFs. In the reference area, the earthworms have lower BAFs than the non-earthworm invertebrates. In the study areas, the earthworms have higher BAFs than the non-earthworm invertebrates. This indicates that uptake factors in the OU-1 Refined SLERA Area are likely dependent on TCDD TEQ concentrations, as well as TOC, and other soil characteristics. Table J4-4 shows a summary of these values.

The Site TEQs are directly comparable to the Young et al. (1987) and Kay et al. (2005) studies (as shown in Tables J4-3 and J4-4, and the following table). Those studies measured TCDD uptake. The toxicity equivalency factor for TCDD for both birds and mammals is 1, so 1 nanogram per kilogram (ng/kg) of TCDD equals 1 ng/kg of TEQ.

Study	Average TEQ ng/kg	High End TEQ[a] ng/kg
Young 1987	157	325
Kay 2005	2.04	2,530
OU-1 Refined SLERA Area: Avians	920	1,443
OU-1 Refined SLERA Area: Mammals	478	870

a. High end concentrations for literature-based studies represent the maximum of calculated mean concentrations, and 95% UCLs for the OU-1 refined SLERA.

Of the samples for avian TEQs at the Operations Area, 165 or 68% are less than 325 ng/kg. For the mammalian TEQ samples at the Operations Area, 183 or 76% are less than 325 ng/kg. The Operations Area is most likely to have uptake values more similar to the lower end TCDD sites in the studies than the higher end TCDD sites in the studies.

2.6 Summary of Uptake Factors

In the OU-1 Refined SLERA Area, this leaves us with a variety of possible options for invertebrate uptake values for TCDD. This uncertainty analysis explores five of those values covering three orders of magnitude (as shown in Table J4-5 and the following table).

Uptake to Terrestrial Invertebrates	**BAF (ww)**
Lowest Literature BAF	0.00898
Uptake factor used for OU-1 refined SLERA (see main text)	0.19
Calculated using Eco-SSL formula at average TOC	0.90
Average Literature BAF	0.39
USEPA Region 6	1.59

However, during the site reconnaissance, a trained ecologist noted that the actual distribution of invertebrates at the site was roughly 45% crickets, 45% other insects, and 10% burrowing spiders, or other organisms like scorpions with a similar lifestyle, trophic level, and exposure patterns. A weighted average of the high-and-low end studies for these organisms results in a BAF of 0.19, as shown in the following table.

Calculation of a Weighted Average BAF for the OU-1 Refined SLERA Area			
	BAF	**%**	**Contribution**
Crickets (average of 4 values)	0.104	45%	0.047
Soil/Plant Insects (average of 2 values)	0.189	45%	0.085
Burrowing Spiders (average of 2 values)	0.544	10%	0.054
Weighted Average BAF			**0.19**

The TEQ concentrations for OU-1 soil vary for Eco DU-1, Eco DU-2, Eco DU-3, and Parcel E, with the lowest TEQ in Eco DU-2 and Parcel E and the highest TEQ in Eco DU-1, as summarized below:

TEQ (ng/kg, ppt)	95% UCL TEQ by Area			
	Eco DU-1	Eco DU-2	Eco DU-3	Parcel E
Dioxin/Furan Bird TEQ	1,870	63	1034	120
Dioxin/Furan Mammal TEQ	1,110	28	527.6	75.7

ng/kg = nanograms per kilogram, ppt = parts per trillion

These concentrations are in the range of the Young et al. (1987) and the Kay et al. (2005) studies. Based on the available information, including the range of BAFs calculated using the USEPA Eco-SSL (2007b) formulae and OU-1 organic carbon data, the BAF used for OU-1 is the weighted average BAF of 0.19. The uncertainty associated with the BAF is discussed in the uncertainty assessment.

3. THE EFFECT OF BAFS ON THE FOOD WEB MODEL

A limited food web model (FWM) was constructed to demonstrate the effects of the range of terrestrial invertebrate uptake factors for TCDD on risk estimates. This FWM was constructed in the same way as the FWM described in Section 4.5 in the main text of the OU-1 refined SLERA. The exposure point concentrations (EPCs) used were the maximum and 95% UCL for mammalian and avian TEQs for the Operations Area (Table J4-6). The wildlife receptors (Table J4-7) are identical to the ones used Table 4-7a in the main text of the OU-1 refined SLERA, but only those receptors that consume terrestrial invertebrates are used. The toxicity reference values (TRVs) (Table J4-8) are the same no observed adverse effects level (NOAEL) and lowest observed adverse effects level (LOAEL) that were used in the FWM (as described in Section 4.5.3 and Table 4-7b of the main text of the OU-1 refined SLERA). The receptor-specific risk calculations are shown on Tables J4-9a through J4-9f and summarized in Table J4-10. A FWM with an area use factor (AUF) of one is shown for these receptors and the fringed myotis and the raccoon are also shown with a species- and site-specific AUF of less than one.

The excerpt from Table J-10 below illustrates the range of HQs over the range of BAFs considered in the uncertainty analysis. The BAF value used for the OU-1 refined SLERA, including the Operations Area, the three ecological decision units within the Operations Area, and Parcel E, was 0.195.

Table J-10 Excerpt: Example Hazard Quotients Calculated Using the 95% UCL for Operations Area and a Range of BAFs			**Western Burrowing Owl AUF = 1**		**American Robin AUF = 1**	
Concentration Type	**Invertebrate Uptake Value in Wet Weight**	**Source**	**NOAEL HQ**	**LOAEL HQ**	**NOAEL HQ**	**LOAEL HQ**

4. UNCERTAINTIES

While these BAFs are presented from peer-reviewed primary literature, they still represent substantial uncertainties for use at this Site. BAFs are strongly influenced by the soil TOC and concentration of TCDD in the soil. Nonetheless, the BAFs used in the risk assessment are appropriate for use in the food web model for understanding where potential risks exist and for what receptors within the OU-1 Refined SLERA Area may be at risk. In regard to the BAFs used in the OU-1 refiend SLERA food web model,the assessment must consider a variety of uncertainties, as summarized in the following table:

Uncertainty	**Effect on HQs**
Soil type between the experimental sites may have vastly different TOC than the relatively sandy soils in the OU-1 Refined SLERA Area. TCDD is strongly hydrophobic and partitions readily into organic carbon.	Unknown
The type of carbon, as well as the amount of carbon, can affect the sorption of dioxins and furans. (Cornelissen et al. 2008 and Lambert et al. 2011).	Unknown
The relatively high lipid content of earthworms may (or may not) be at odds with the insects that are actually present in the OU-1 Refined SLERA Area. The lipid content of insects strongly affects uptake of large hydrophobic constituents.	Unknown.
The BAFs vary with concentration of TOC in the soil. The soil in the Operations Area has TOC values from 300 to 15,800 mg/kg. Each of these locations will have slightly different uptake of TEQs. Using one central tendency value for TEQ uptake does not take into account the complexity of the soil data.	Overestimates HQs in some locations and underestimates HQs in others
BAFs vary with concentration of dioxins and furans. The higher the concentration of dioxins and furans, the lower the BAF. There is a wide spectrum of TEQ concentrations that vary over six orders of magnitude. Each of these locations will have slightly different uptake of TEQs. Using one central tendency value for TEQ uptake does not take into account the complexity of the soil data.	Overestimates HQs in some locations and underestimates HQs in others
The measured physical constants for TCDD (K_{ow} and K_{oc}) are from a reliable USEPA source, but these are only one estimate. Different sources have found other values for these constants that vary significantly.	Unknown
The FWM only considers the effects of dioxin and furan TEQs. However, there are some locations with PCBs as well. These two classes of constituents have an additive toxicological effect.	Underestimates HQs

TOC = Total Organic Carbon
U = Not detected

TABLE J4-2. Calculation of Eco-SSL-based Uptake Factors for Dioxins and Furans Based on Soil TOC
Nevada Environmental Response Trust Site
Henderson, Nevada

Log(Kow) for TCDD =	**6.8**	Source = USEPA 2000
Koc for TCDD =	**3.98E+06**	Source = USEPA 2000

foc Value	foc	Kww	Kd	Uptake Factor in Wet Weight
Average foc (ND=0.5*DL)	0.0023	8,241	9,154	0.900
85th percentile foc (ND=0.5*DL)	0.0052	8,241	20,696	0.398
95th percentile foc (ND=0.5*DL)	0.0086	8,241	34,228	0.241
99th percentile foc (ND=0.5*DL)	0.012	8,241	47,760	0.173
Maximum foc	0.016	8,241	63,680	0.129

The Eco-SSL Guidance (USEPA 2007) suggests this formula for calculating uptake of organic constituents to soil based on soil foc and the Kow of a constituent (see text for explaination).

$$C_{worm} = C_{soil} \times \left(\frac{K_{ww}}{f_{oc} \times K_{oc}} \right)$$

Where Kww =

$$Log(K_{ww}) = 0.87 \times Log\ (K_{ow}) - 2$$

Notes:
Csoil = Concentration in soil
Cworm = concentration in earthworms
DL = Detection limit
Eco-SSL = Ecological soil screening levels
foc = Fraction of organic carbon
Kd = soil to water partitioning coefficient
Koc = Organic carbon partitioning coefficient
Kow = Octanol-water partitioning coefficient
Kww = Biota to soil water partitioning coefficient
Log = Logarithim base 10
ND = Nondetects
TCDD = 2,3,7,8-tetrachlorodibenzodioxin
USEPA = United States Environmental Protection Agency

USEPA. 2000. Exposure and Human Health Reassessment of 2,3,7,8-Tetrachlorodibenzo-p-Dioxin (TCDD) and Related Compounds. Part I: Estimating Exposure to Dioxin-Like Compounds. Volume 4: Site-Specific Assessment Procedures. Draft. Exposure Assessment and Risk Characterization Group, Office of Research and Development, Washington, DC. September.

USEPA. 2007. Guidance for Developing Ecological Soil Screening Levels (Eco-SSLs). Attachment 4-1 Exposure Factors and Bioaccumulation Models for Derivation of Wildlife Eco-SSLs. OSWER Directive 9285.7-55. Revised April 2007.

TABLE J4-3. Uptake Factors for Dioxins and Furans From Literature
Nevada Environmental Response Trust Site
Henderson, Nevada

Young 1987 Table 3	Number of Samples	Soil TCDD in Parts Per Trillion		
		Range	Median	Mean
Grid I	22	<10-1,500	110	325
Grid II	6	<10-470	30	115
Grid IV	26	<10-150	20	30
			Average	**157**

Young 1987 Table 7	Invertebrate TCDD in Parts Per Trillion	Calculated TCDD BAF Based on Average Concentration	Calculated TCDD BAF Based on Grid I Concentration
Grasshoppers	ND	--	--
Crickets (minimum)	18	0.11	0.06
Crickets (maximum)	26	0.17	0.08
Soil/Plant Insects	40	0.26	0.12
Burrow Spiders	115	0.73	0.35
Beetle Grubs	238	1.52	0.73
Average	**87.4**	**0.56**	**0.27**

Kay 2005 Table 2	TCDD TEQ ng/kg			Calculated BAF Based on Soil From		
	Reference Mean	TTP Location Mean	IP Location Mean	Reference Mean	TTP Location Mean	IP Location Mean
Soil	2.04	2530	2450	--	--	--
Depurated earthworms	0.612	83.5	76.1	0.30	0.033	0.031
Fresh earthworms	0.686	129	96.4	0.34	0.051	0.039
Terrestrial, non-earthworm invertebrates	1.13	15.8	28.7	0.55	0.0062	0.0117
Terrestrial, non-earthworm invertebrates average of TTP and IP Locations	1.13	22.25		0.55	0.00898	

Study and Organism	Low End Estimate of BAF	High End Estimate of BAF
Young 1987 Crickets Minimum	0.0554	0.115
Young 1987 Crickets Maximum	0.0800	0.166
Young 1987 Soil/Plant Insects	0.123	0.255
Young 1987 Burrow Spiders	0.354	0.734
Young 1987 Beetle Grubs	0.732	1.52
Kay 2005 Non-Earthworm Invertebrates	0.00898	0.554

Average of these BAFs	**0.391**
Lowest BAF	**0.00898**
Highest BAF	**1.52**

Notes:
< = Less than
BAF = bioaccumulation factor, unitless
IP= Imerman Park
ng/kg = nanograms per kilogram
TCDD = 2,3,7,8-tetrachlorodibenzodioxin
TTP = Tittabawassee Township Park

Kay, D., A. Blankenship, M. Zwiernik, J. L. Newsted, P. D. Jones and J. P. Giesy. 2005. PCDDs and PCDFs in Aquatic and Terrestrial Food Webs of the Tittabawassee River, Michigan, USA. Organohalogen Compounds. 67:2130-2133.

Young, A. L., Cockerham, L. G., & Thalken, C. E. (1987). A long-term study of ecosystem contamination with 2,3,7,8-tetrachlorodibenzo-p-dioxin. Chemosphere, 16(8-9), 1791–1815.

Dioxin and Furan TEQs	Calculated using Eco-SSL formula at average TOC	0.900	c	WW	0.900
Dioxin and Furan TEQs	Calculated using Eco-SSL formula at 85th percentile foc	0.398	c	WW	0.398
Dioxin and Furan TEQs	Calculated using Eco-SSL formula at 95th percentile foc	0.241	c	WW	0.241
Dioxin and Furan TEQs	Uptake factor used for OU-1 Refined SLERA	0.190	--	WW	0.190
Dioxin and Furan TEQs	Calculated using Eco-SSL formula at 99th percentile foc	0.173	c	WW	0.173
Dioxin and Furan TEQs	Calculated using Eco-SSL formula at maximum foc	0.131	c	WW	0.131
Dioxin and Furan TEQs	USEPA Region 6	1.59	a	WW	1.59
Dioxin and Furan TEQs	Lowest Literature BAF	0.00898	d	WW	0.00898
Dioxin and Furan TEQs	Average Literature BAF	0.391	d	WW	0.391
Dioxin and Furan TEQs	Highest Literature BAF	1.52	d	WW	1.52

(a) USEPA Region 6. 1999. Screening level ecological risk assessment protocol for hazardous waste combustion facilities. Volume One. EPA530-D-99-001A. August. Appendix C2: Soil-to-plant and sediment-to-plant bioaccumulation factors.

(b) USEPA Region 6. 1999. Screening Level Ecological Risk Assessment Protocol for Hazardous Waste Combustion Facilities. Volume One (EPA530-D-99-001A). August. Appendix D: bioaccumulation factors for wildlife measurement receptors. Value for 2,3,7,8-TCDD and least shrew used as a surrogate.

(c) Ramboll calculated uptake factor based on USEPA 2007. USEPA. 2007. Guidance for Developing Ecological Soil Screening Levels (Eco-SSLs). Attachment 4-1 Exposure Factors and Bioaccumulation Models for Derivation of Wildlife Eco-SSLs. OSWER Directive 9285.7-55. Revised April 2007. See appendix text for more details regarding the calculation. Value for 2,3,7,8-TCDD used as a surrogate. See previous table.

(d) These values were taken from two papers that had BAFs for non-earthworm invertebrates. See text and previous table.

Plants are assumed to be 15% solids. The dry weight is multiplied by 0.15 to convert to wet weight.

Notes:
BAF = bioaccumulation factor
DW = Dry weight
Eco-SSL = Ecological soil screening level
OU-1 = OU-1 Refined SLERA Area
TEQ = Toxic equivalent quotient
TOC = Total Organic Carbon
USEPA= United States Environmental Protection Agency
WW = Wet weight

TABLE J4-6. Operations Area Exposure Point Concentrations for Dioxin and Furan TEQs

Nevada Environmental Response Trust Site
Henderson, Nevada

Constituent	Operations Area (mg/kg)	
	95% UCL	MAX
Calculated D/F Avian TEQ (ND=0.5DL)	1.44E-03	4.49E-02
Calculated D/F Mammal TEQ (ND=0.5DL)	8.70E-04	3.14E-02

Notes:
% = Percent
D/F = Dioxin and furans
DL = Detection limit
MAX = Maximum
mg/kg = Milligrams per kilogram
ND = Nondetects
TEQ = Toxicity equivalent quotient
UCL = Upper confidence level

TABLE J4-7: Summary of Wildlife Food Web Input Variables and Receptor Parameters

Notes:
The sources of the receptor parameter information are found in Appendix G.
Note that this ONLY includes receptors that eat invertebrates.

Facility Area Size (in hectares): 140

% = Percent
AUF = Area use factor
BW = Body weight
ED = Exposure duration - percentage of the year the receptor spends in the area
ha = Hectares
Inverts = Invertebrates
IR f = Ingestion rate of food (wet weight)
IR s = Ingestion rate of surface soil (dry weight)
IR w = Ingestion rate of water
kg = Kilograms
kg dw/day = Kilograms dry weight per day
kg ww/day = Kilograms wet weight per day
L/day = Liters per day

TABLE J4-8. Dioxin and Furan Toxicity Reference Values for Mammals and Birds
Nevada Environmental Response Trust Site
Henderson, Nevada

Chemical	Mammal TRV		Avian TRV	
	NOAEL	LOAEL	NOAEL	LOAEL
Dioxin and Furan TEQs	8.40E-06	3.10E-05	1.40E-05	1.40E-04

Notes:
D/F = Dioxin/furans
LOAEL = Lowest observed adverse effects level
mg/kg-bw/day = Milligrams per kilogram body weight per day
NOAEL = No observed adverse effects level
TEQ = Toxic equivalent quotient
TRV = Toxicity reference value
TSRF = Tittabawassee & Saginaw River & Floodplain

The source of the TRVs are explained in Section 4 of the main text.

UNCERTAINTIES ASSOCIATED WITH THE USE OF ECOSAR FOR SOIL CRITERIA

UNCERTAINTIES USING THE ECOSAR MODEL FOR SOIL CRITERIA

Overview

Many of USEPA Region 4's soil criteria (USEPA 2018) are based on the ECOSAR model (https://www.epa.gov/tsca-screening-tools/ecological-structure-activity-relationships-ecosar-predictive-model) combined with the "Region 4 soil model." ECOSAR estimates aquatic toxicity values for each chemical based on only the chemical structure and solubility. The relationship of chemical structure to biological activity and toxicity is called a "structure-activity relationship" (SAR). The math from ECOSAR predicts a Quantitative Structure-Activity Relationship (QSAR) which predicts quantitative toxicological endpoints for aquatic organisms (green algae, daphnids, and fathead minnows) based solely on the chemical structure and water solubility. The Region 4 soil model calculates a soil criterion based on the water quality benchmark from ECOSAR, the soil fraction of organic carbon (assumes 1% soil organic carbon), chemical characteristics, and three assumed values of soil (water content, aeration porosity, and soil bulk density).

There are many uncertainties in this process, not the least of which are due to the difference between whatever aquatic organism the ECOSAR was based on (Region 4 does not specify and has not released the ECOSAR information for the modeled chemicals) and soil invertebrates coupled with the specificity and accuracy of the ECOSAR model itself. While the ECOSAR toxicity values are a useful place to start an investigation of chemicals where there is little-to-no toxicity testing, in general, actual measured toxicity values are less uncertain than modeled ones. ECOSAR itself was designed to be able to process large number of chemicals in relatively short timespans to prioritize further testing (Cronin et al., 2003; Sanderson, 2003; de Hass et al., 2011; Hulzebos and Posthumus, 2019), not for creating environmental criteria. The reason why it is not generally used for the creation of criteria is because of the uncertainties inherent in ECOTOX. For instance, some of the structure-activity relationships are based on as few as four chemicals and have an r^2 value (r^2 is an estimate of how well one variable predicts another variable, or how well ECOSAR estimated toxicity estimates measured toxicity) of 0.7 (Hulzebos and Posthumus, 2019). The USEPA (Office of Pollution Prevention and Toxics, Toxic Substances Control Act, Endocrine Disruptors Screening and Testing Advisory Committee, chemical premanufacture notifications) relies on ECOSAR to help screen chemicals to find those in need of the most urgent testing (Cronin et al., 2003) but they did not choose to use them for the federally promulgated water quality criteria (which are based on copious biological testing). While ECOSAR is a good tool to show where to start an investigation, it rarely is the last word on the subject.

The Last 25 Years of ECOSAR

As the ECOSAR model has been in a state of continuous improvement for the better part of 25 years. Through the years, many studies have striven to show how well it works.

- Kaiser et al., (1999) was published the year after ECOSAR became publicly available (though structure-activity relationships had been a subject of scientific interest by the USEPA since the early 80s). Their initial analysis was:

  "Our concerns with ECOSAR are threefold:

(i) most of the linear correlations developed from the empirical toxicity data are statistically insignificant as they are derived from too few measured data - obvious from correlation coefficients near or at 1.0;

(ii) the statistics stated for many of the equations are highly inflated by including several measurements for the same compound as independent variables within one class of compounds - up to three times the actual number of compounds; and

(iii) the classification of compounds is inconsistent and contains elements of both a chemical nature and the compounds' use - the latter is subject to interpretation and change."

In the next couple of decades of scientific literature, these concerns haven't changed - though the underlying data has gotten much better.

- Hulzebos and Posthumus (2003) found that ECOSAR predicted the wrong magnitude of toxicity for about one third of the roughly 60 chemicals tested. In fact, when they set up reasonable criteria for "unreliable" QSARs (such as the QSAR is based on $n \leq 4$ data or number of data is not recorded, $r^2 < 0.7$, lack of regression lines, misclassification of a chemical) they found that out of the 46 classes of chemicals and 123 structure-activity relationships in ECOSAR that 78% if the structure-activity relationships were considered "unreliable".
- Sanderson et al., (2003) compared ECOSAR and experimental data for 20 pharmaceutical chemicals and found that 80% of the chemicals tested, ECOSAR overestimated the environmental toxicity of these chemicals (see Figure 4 of that document). Pharmaceutical chemicals are (necessarily) biologically active and may have toxic modes of action that are quite different than the chemicals used to develop the math underlying ECOSAR (for instance, the pharmaceutical may disrupt bacterial cell walls – so testing it on algae, daphnids, and fathead minnows is of questionable use). The open question is, does ECOSAR adequately model the modes of action of the constituents of concern?
- Bermúdez-Saldaña (2005) compared ECOSAR vs ECOTOX data for dimethoate and found that ECOSAR underestimated its toxicity.
- Tunkel et al., (2005) summarized the results of an intense workshop in Setubal, Portugal in 2002 by the Society for Environmental Toxicology and Chemistry that began the process of creating guidance on "the development and use of QSARs". The journal for that society - Environmental Toxicology and Chemistry - devoted an entire issue (volume 22, number 8, 2003) to review articles about mathematical models of chemical properties, fate and effects, and biological activity - QSARs. They noted that there were insufficient studies that compared QSAR predicted toxic concentrations to measured toxicity values (and in the next decade-or-so of research, many papers were published that did just this). They used ECOSAR (and other models) to predict toxicity for chemicals that were not present in the model database. ECOSAR had an r^2 of 0.74 for fish, though no data for invertebrates were compared.
- Reuschenbach et al., (2008) set out to compare acute toxicity data for fish, daphnids, and green algae with ECOSAR outputs for 1000 chemicals. For daphnids (presumably the organism USEPA Region 4 used in their soil criteria development)

ECOSAR predicted the toxicity testing derived value in 51.5% of samples, overestimated toxicity in 26.5% of samples, and underpredicted toxicity in 22% of samples (see Table 4 of Reuschenbach et al., 2008).

- Dom et al., (2010) compared ECOSAR predictions versus experimental data for a set of four chloroanilines. For algae, ECOSAR predicted the same magnitude of toxicity as the experimental data in 3 of 4 chemicals. For daphnids, it was 1 of 4 chemicals, and for fish it was 2 of 3 chemicals.
- de Hass (2011) compared ECOSAR output to toxicity data for about 20 chemicals to investigate its performance calculating fish chronic toxicity, and found generally excellent agreement, with ECOSAR showing a slight overestimation. They also reported that the validation for long term algae was good, but that daphnids had a much lower validation ratio.
- Barron et al., (2012) prepared ECOSAR toxicity values (using KowWin from USEPA's EPI Suite program https://www.epa.gov/tsca-screening-tools/epi-suitetm-estimation-program-interface to calculate octanol-water partitioning coefficients – K_{ow}s) for nine chemicals and compared them to actual lab and field measured aquatic toxicity values from the USEPA's ECOTOX Database (https://cfpub.epa.gov/ecotox/) and used the data sets to find the 5th percentile of values. The 5th percentile of values, protective of 95% of the species surveyed, is sometimes used to create regulatory criteria (Barron et al., 2012). Barron compared the values from ECOSAR and ECOTOX and found the following over- and under-estimations of toxicity (see Table 3 and Figure 3 from Barron et al., 2012):
    - Endrin - overestimate by 81x
    - Malathion - overestimate by 22x
    - Pentachlorophenol - overestimate by 5.3x
    - Benzene - overestimate by 1.5x
    - Carbaryl - underestimate by 1.2x
    - 4-Nitrophenol - underestimate by 1.7x
    - Phenol - underestimate by 2.9x
    - Ethylbenzene - underestimate by 3.3x
    - Permethrin - underestimate by 4.5x
- Melnikov et al., (2016) compared ECOSAR versus four other models to calculate acute toxicity of 83 organic chemicals to fish. To truly test the predictive ability of these models, they used chemicals that were not part of the dataset used to derive the QSARs. ECOSAR was the second most accurate model (out of five models tested). ECOSAR's total accuracy was 61%. The authors state that at least part of the reason for this is that even in 2016, 18 years after the model was released, some QSARs were still "based on as few as 2 data points".
- He et al., (2019) compared 10 other models to ECOSAR to compare their predictive ability for pesticide toxicity to daphnids. ECOSAR performed more poorly than the other 10 models.

- Khan et al., (2019) developed QSARs for toxicity to fish for several classes of organic compounds (aldehydes, amides, esters, phenols etc.). In every case, in the training data and the test data, their QSARs outperformed ECOSAR (see Table 2 of that study).
- Massarsky et al., (2022) compared measured and ECOSAR-predicted LC50s for polyfluorinated chemicals. For perfluorooctanoic acid they found that ECOSAR underestimated measured toxicity by 2-84x for fish, underestimated measured toxicity by 16x-108x for daphnids, and underestimated toxicity by 10x for mysids. ECOSAR underestimated toxicity of perfluorooctanesulfonic acid by 1.3-3x for fish and by 1.7x for mysids. Polyfluorinated chemicals are of relatively recent interest to the scientific community and the ECOSAR predictive capabilities are not fully modeled.

The Future of ECOSAR

The continuous improvement of ECOSAR is still in process. Wang et al., (2022) used machine learning algorithms to create a better model for rotifer NOECs. Xu et al., (2022) surveyed nearly two thousand chemicals using machine learning and deep learning to build predictive toxicity models that could be incorporated into ECOSAR. Shavalieva et al., (2022) developed an automated literature search program to extract potential data for the development of QSARs and then released the source code for other interested parties. While ECOSAR is an irreplaceable tool to find chemicals in need of further testing, it is still far from perfect. The USEPA Region 4 does not provide their ECOSAR output for the chemicals in their soil criteria based on ECOSAR output. The strength of the toxicity values that depend on that output is unknown and should be treated as a substantial uncertainty.
