REFINED SCREENING-LEVEL ECOLOGICAL RISK ASSESSMENT FOR OPERABLE UNIT 1, REVISION 2

NEVADA ENVIRONMENTAL RESPONSE TRUST SITE HENDERSON, NEVADA

RAMBOLL

Refined Screening-Level Ecological Risk Assessment for Operable Unit 1, Revision 2

Nevada Environmental Response Trust (Former Tronox LLC Site) Henderson, Nevada

Nevada Environmental Response Trust (Trust) Representative Certification
I certify that this document and all attachments submitted to the Division were prepared at the request of, or under the direction or supervision of the Trust. Based on my own involvement and/or my inquiry of the person or persons who manage the system(s) or those directly responsible for gathering the information or preparing the document, or the immediate supervisor of such person(s), the information submitted and provided herein is, to the best of my knowledge and belief, true, accurate, and complete in all material respects.

Office of the Nevada Environmental Response Trust

LePetomane XXVII, Inc., not individually, but solely in its representative capacity as the Nevada Environmental Response Trust Trustee

Not Individually, but Solely as President of the Trustee

Signature: Jay A Steinberg, President

Name: Jay A. Steinberg, not individually, but solely in his representative capacity as President of the Nevada Environmental Response Trust Trustee

Title: Solely as President and not individually

Company: LePetomane XXVII, Inc., not individually, but solely in its representative capacity as the Nevada Environmental Response Trust Trustee

Date: 12/18/23

Refined Screening-Level Ecological Risk Assessment for Operable Unit 1, Revision 2

Nevada Environmental Response Trust (Former Tronox LLC Site) Henderson, Nevada

Responsible Certified Environmental Manager (CEM) for this project

I hereby certify that I am responsible for the services described in this document and for the preparation of this document. The services described in this document have been provided in a manner consistent with the current standards of the profession and, to the best of my knowledge, comply with all applicable federal, state and local statutes, regulations and ordinances.

Kimberly Kuwabara

December 18, 2023

Kimberly Kuwabara **Date**
Senior Managing Consultant

Certified Environmental Manager
Ramboll Americas Engineering Solutions, Inc.
CEM Certificate Number: EM2353
CEM Expiration Date: March 20, 2025

The following individuals provided input to this document:

Christopher M. Stubbs, PhD, PE
Scott Hayter, PE PG
Linda Martello, PhD
Kimberly Kuwabara, MS
Elizabeth Miesner, MS
Kun Zhao
Mary Sorensen, CSE

CONTENTS

ACRONYMS AND ABBREVIATIONS **XI**

EXECUTIVE SUMMARY **ES-1**

OU-1 Refined SLERA Approach ES-1
Step 3a Refined Screening Approach ES-4
Results for the Assessment of the Plant and Soil Invertebrate Community ES-6
Results for the Assessment of the Bird and Mammal Populations ES-6
OU-1 Refined SLERA Conclusions ES-6

1. INTRODUCTION **1-1**

1.1 Refined SLERA Objectives and Approach 1-4
1.2 Refined SLERA: Steps 1 – 3a of the Eight Step USEPA Risk Assessment Process 1-5
1.3 Refined SLERA Report Organization 1-7

2. STEP 1: SCREENING-LEVEL PROBLEM FORUMULATION AND ECOLOGICAL EFFECTS CHARACTERIZATION **2-1**

2.1 Screening-Level Problem Formulation 2-1
2.1.1 OU-1/NERT Site Study Area History 2-1
2.1.1.1 Parcel E 2-3
2.1.2 Environmental Setting 2-3
2.1.2.1 Regional Ecology 2-3
2.1.2.2 Local Ecology 2-4
2.1.2.3 Climate 2-5
2.1.2.4 Geology 2-5
2.1.2.5 Local Hydrogeology 2-6
2.1.3 Wildlife in the Vicinity of OU-1 2-7
2.1.4 Ecological Exposure Media within OU-1 2-7
2.1.5 Preliminary Chemicals of Potential Ecological Concern 2-8
2.1.5.1 Data Used in the OU-1 Refined SLERA 2-9
2.1.5.2 Evaluation of Site Concentrations Relative to Background Conditions 2-12
2.1.5.3 Radionuclide-Specific Evaluation 2-15
2.1.6 Description of Potentially Exposed Receptors 2-15
2.1.7 Identification of Potentially Complete Exposure Pathways 2-16
2.1.8 Identification of Generic Assessment and Measurement Endpoints 2-17
2.2 Screening-Level Ecological Effects Evaluation 2-18

3. STEP 2: SCREENING-LEVEL EXPOSURE ASSESSMENT AND RISK CALCULATION **3-1**

3.1 Identification of Screening-Level Exposure Estimates 3-1
3.2 Screening-Level Risk Calculations 3-1

3.3 Screening-Level Risk Results 3-3
3.3.1 Tier 1 Operations Area Screening Results 3-4
3.3.2 Eco DU-1 Screening Results 3-5
3.3.3 Eco DU-2 Screening Results 3-5
3.3.4 Eco DU-3 Screening Results 3-5
3.3.5 Parcel E Screening Results 3-6
3.3.6 Spatial Plots for Constituents with Maximum Soil Concentrations that Exceed Conservative ESVs 3-6
3.3.6.1 Perchlorate 3-7
3.3.6.2 Dioxin/Furans 3-7
3.3.6.3 Metals 3-7
3.3.6.4 SVOCs 3-8
3.3.6.5 VOCs 3-8
3.3.6.6 Pesticides 3-8
3.3.6.7 PCBs and Petroleum Hydrocarbons 3-8
3.4 SMDP for the OU-1 Refined SLERA 3-9

4. STEP 3A: REFINED SCREENING AND UNCERTAINTY ASSESSMENT 4-1
4.1 Refined Exposure Point Concentrations 4-1
4.1.1 Chemicals Retained for Further Evaluation 4-2
4.2 Assessment Endpoints Considered for the Screening Refinement 4-4
4.3 Measurement Endpoints Used to Refine COPECs 4-5
4.4 Risk Characterization to Plants and Soil Invertebrates Via Direct Contact Pathways 4-6
4.4.1 Refined Risk Calculations for Plants Via Direct Contact Pathways 4-6
4.4.1.1 Operations Area 4-7
4.4.1.2 Eco DU-1 4-9
4.4.1.3 Eco DU-2 4-9
4.4.1.4 Eco DU-3 4-10
4.4.1.5 Parcel E 4-10
4.4.1.6 Conclusions 4-11
4.4.2 Refined Risk Calculations for Invertebrates Via Direct Contact Pathways 4-12
4.4.2.1 Operations Area 4-12
4.4.2.2 Eco DU-1 4-15
4.4.2.3 Eco DU-2 4-15
4.4.2.4 Eco DU-3 4-15
4.4.2.5 Parcel E 4-16
4.4.2.6 Conclusions 4-16
4.5 Risk Characterization for Birds, Mammals, and Reptiles via Food Web Pathways 4-18

4.5.1 Wildlife Receptors of Interest 4-18
4.5.2 Exposure Assessment for Food Web Pathways 4-19
4.5.2.1 Total Daily Dose 4-19
4.5.2.2 Bioaccumulation and Bioconcentration Factors 4-21
4.5.2.3 Bioaccumulation and Bioconcentration Factors for TEQ 4-22
4.5.2.4 Exposure Parameters 4-25
4.5.2.5 Calculation of Potential Doses 4-26
4.5.3 Effects Assessment for Food Web Pathways 4-27
4.5.3.1 Bird Dioxin/Furan TEQ TRVs 4-27
4.5.3.2 Mammal Dioxin/Furan TEQ TRVs 4-28
4.6 Refined Risk Calculations for Food Web Pathways 4-30
4.6.1 Risk Characterization for the Food Web Pathways 4-31
4.6.2 Food Web Risk Characterization Results 4-31
4.6.2.1 Risk Characterization for Birds and Mammals: Operations Area 4-33
4.6.2.2 Risk Characterization for Birds and Mammals: Eco DU-1 4-35
4.6.2.3 Risk Characterization for Birds and Mammals: Eco DU-2 4-36
4.6.2.4 Risk Characterization for Birds and Mammals: Eco DU-3 4-37
4.6.2.5 Risk Characterization for Birds and Mammals: Parcel E 4-39
4.6.2.6 Risk Summary for All OU-1 Refined SLERA Area Spatial Units 4-39
4.6.2.7 Risk Characterization for Reptiles 4-44
4.7 Characterization of Uncertainties 4-44
4.7.1 Detected Chemicals Lacking ESVs 4-46
4.7.1.1 General Chemistry 4-46
4.7.1.2 Nitrates and Nitrites 4-47
4.7.1.3 Ortho-phosphate and Sulfate 4-47
4.7.1.4 Metals 4-47
4.7.1.5 VOCs/SVOCs 4-47
4.7.1.6 Chlorine Oxyanions 4-48
4.7.2 Detected Chemicals Lacking Species-Specific ESVs 4-48
4.7.3 Evaluation of Chemicals with Low Detection Frequencies 4-49
4.7.4 Uncertainties in the Background Evaluation 4-49
4.7.5 Uncertainties in the Evaluation of DDT and Metabolites 4-52
4.7.6 Evaluation of Detection Limit Uncertainties 4-55
4.7.6.1 Uncertainties in the Evaluation of Criteria Based on ECOSAR 4-61
4.7.7 Uncertainties in the Evaluation of Risk to Reptiles 4-62
4.7.8 Uncertainty Assessment Conclusions 4-63

5. OU-1 REFINED SLERA CONCLUSIONS 5-1

5.1 Results for the Assessment of the Plant and Soil Invertebrate Community 5-3
5.2 Results for the Assessment of the Bird and Mammal Populations 5-4

5.3 OU-1 Refined SLERA Conclusions 5-4

APPENDICES

Appendix A USEPA Completed Ecological Site Reconnaissance Checklist
Appendix B December 2014 and June 2022 Site Reconnaissance Photo Log
B-1 Operations Area Photos
B-2 Area to the North of the Operations Area
B-3 Excavation Control Areas
Appendix C Data Management
C-1 Summary of Soil Samples Removed from SLERA Dataset due to Remediation or Inaccessibility to Wildlife
C-2 List of Chemicals for which Names and/or CASRN were Standardized for SLERA Process
C-3 Summary of Soil Data Excluded During Data Processing
C-4 Summary of Rejected Soil Data
C-5 Revisions of Censored Data for Blank Contamination
C-6 Data Usability Evaluation Summary
Appendix D Analytical Data Used in the OU-1 Refined SLERA
D-1 Operations Area and Parcel E SLERA Dataset for Individual Chemicals and Radionuclides
D-2 Operations Area and Parcel E SLERA Dataset for Ramboll Calculated Parameters

D-3 Operations Area and Parcel E Dioxin/Furan and PCB Toxic Equivalency Quotient Calculations
D-4 Operations Area and Parcel E PCB Homolog Calculations
D-5 Operations Area and Parcel E Aroclor Calculations
D-6 Operations Area and Parcel E PAH Calculations
D-7 Operations Area and Parcel E DDx Calculations
Appendix E Background Data
E-1 Background Data Used in the OU-1 Refined SLERA
E-2 Background Statistical Evaluation
Appendix F Summary of 95% UCLs for Constituents Retained for Refined Screening by Spatial Unit
F-1 Summary of 95% UCLs for Constituents Retained for Refined Screening by Spatial Unit
Appendix G Location-Specific Screening for Terrestrial Plants and Invertebrates
G-1 Location-Specific Screening for Manganese and Perchlorate for Potential Risks to Terrestrial Plants: Operations Area
G-2 Location-Specific Screening for Manganese, Mercury, and Perchlorate for Potential Risks to Terrestrial Invertebrates: Operations Area
Appendix H Exposure Parameter Documentation for Receptors
H-1 Food Web Uptake Approach for Plants, Invertebrates and Prey Mammals
H-2 Exposure Parameters
Appendix I Total Daily Intake Documentation for the OU-1 Refined SLERA Food Web Model
I-1 Operations Area
I-2 Eco DU-1
I-3 Eco DU-2
I-4 Eco DU-3
I-5 Parcel E
Appendix J Uncertainty Analysis
J-1 Evaluation of Chemicals Detected Lacking ESVs
J-2 Evaluation of Sample Quantitation Limits for Chemicals Not Detected with ESVs
J-3 Summary of Chemicals Not Detected Lacking ESVs
J-4 Uncertainties Associated with Dioxin and Furan Bioaccumulation Factors for Soil Invertebrates
J-5 Uncertainties Associated with Using ECOSAR For Soil Criteria

ACRONYMS AND ABBREVIATIONS

AF	Assimilation Factor
AhR	aryl hydrocarbon receptor
AMPAC	American Pacific Corporation
AP&CC	American Potash and Chemical Company
ATSDR	Agency for Toxic Substances and Disease Registry
AUF	Area Use Factor
AVG	average
BAF	bioaccumulation factor
BCF	bioconcentration factor
BERA	baseline ecological risk assessment
bgs	below ground surface
BHC	benzene hexachloride
BHRA	baseline health risk assessment
BMI	Black Mountain Industrial
Box-plots	Box-and-whisker plots
BRC	Basic Remediation Company
BW	body weight
CEM	certified environmental manager
C_{FOOD}	concentration in food
COH	City of Henderson
COPEC	Constituent of potential ecological concern
C_s	concentration in soil
CSM	conceptual site model
C_{SOIL}	concentration in soil
C_w	concentration in soil porewater
C_{WATER}	concentration in water
d^{-1}	per day
DDD	dichlorodiphenyldichloroethane
DDE	dichlorodiphenyldichloroethylene
DDT	dichlorodiphenyltrichloroethane
DDx	sum of combined DDT and isomer exposures
DU	decision unit
dw	dry weight

ECA	Excavation Control Area
Eco-SSL	Ecological Soil Screening Level
EFH	extractable fuel hydrocarbons
EMD	EMD Acquisition LLC
ENVIRON	ENVIRON International Corporation
EPC	exposure point concentration
ERA	ecological risk assessment
ESV	ecological screening value
EU	European Union
f_{oc}	fraction of organic carbon
ft	feet
GWETS	Groundwater Extraction and Treatment System
HCB	hexachlorobenzene
HQ	hazard quotient
HRA	Human Health Risk Assessment
IQR	interquartile range
IR_{FOOD}	ingestion rate of food
IR_{SOIL}	ingestion rate of soil
IR_{WATER}	ingestion rate of water
K_d	soil to water partitioning coefficient
Kerr-McGee	Kerr-McGee Chemical Corporation
kg	kilogram(s)
K_{oc}	soil organic carbon to water partitioning coefficient
K_{ow}	octanol-water partitioning coefficient
K_{ww}	biota to soil water partitioning coefficient
L	liter
LANL	Los Alamos National Laboratory
LOAEL	lowest observed adverse effect level
LOEC	Lowest Observable Effect Concentration
LOU	letter of understanding
MAX	maximum
mg	milligram
mph	miles per hour
NDEP	Nevada Division of Environmental Protection

NERT	Nevada Environmental Response Trust
NFA	no further action
ng	nanogram
NOAA	National Oceanographic and Atmospheric Administration
NOAEL	no observed adverse effect level
NOEC	No Observable Effect Concentration
ORNL	Oak Ridge National Laboratory
OSSM	Olin, Stauffer, Syngenta, and Montrose
OSWER	Office of Solid Waste and Emergency Response
OU	operable unit
PAH	polycyclic aromatic hydrocarbon
PBT	persistent, bioaccumulative, and toxic
PCB	polychlorinated biphenyl
PCOPEC	preliminary constituent of potential ecological concern
PeCDF	2,3,4,7,8-pentachlorosibenzo-p-furan
PEPCON	Pacific Engineering and Production Company of Nevada
P_{FOOD}	proportion of food item in diet
ppt	parts per trillion
QSAR	Quantitative Structure Activity Relationship
Ramboll	Ramboll US Corporation (prior to October 1, 2020); Ramboll US Consulting, Inc. (October 1, 2020 to August 31, 2023); Ramboll Americas Engineering Solutions, Inc. (after September 1, 2023)
Ramboll Environ	Ramboll Environ US Corporation
RI	remedial investigation
RI/FS	remedial investigation/feasibility study
RSV	refined screening value
SAR	Structure Activity Relationship
Site	Nevada Environmental Response Trust (NERT) Site
SLERA	screening-level ecological risk assessment
SMDP	scientific management decision point
SOP	Standard Operating Procedure
SQL	Sample quantitation limit
SQuiRT	NOAA Screening Quick Reference Tables
SVOC	semi-volatile organic compound

TCDD	2,3,7,8-tetrachlorodibenzo-p-dioxin
TCDF	2,3,7,8-tetrachlorodibenzofuran
TDD	total daily dose
TDI	total daily intake
TEF	toxic equivalency factor
TEQ	toxicity equivalent quotient
TIMET	Titanium Metals Corporation of America
TPH	total petroleum hydrocarbon
Tronox	Tronox LLC
Trust	Nevada Environmental Response Trust
TRV	Toxicity Reference Value
UCL	upper confidence limit of the mean
UMCf	Upper Muddy Creek formation
US	United States
USACHPPM	United States Army Center for Health Promotion and Preventive Medicine
USEPA	United States Environmental Protection Agency
USFWS	United States Fish and Wildlife Service
VOC	volatile organic compound
WBZ	water bearing zone
WECCO	Western Electronic Chemical Company
WHO	world health organization
wk^{-1}	per week
wt^{-1}	per weight
ww	wet weight
xMCf	transitional Muddy Creek formation

EXECUTIVE SUMMARY

This report presents a refined Screening-Level Ecological Risk Assessment (Refined SLERA) for Operable Unit 1 (OU-1) within the Nevada Environmental Response Trust (NERT or the Trust) Remedial Investigation (RI) Study Area near Henderson, Nevada (Figure ES-1). OU-1, which is also referred to as the NERT Site (Site) Study Area, comprises approximately 346 acres located within the Black Mountain Industrial (BMI) Complex in unincorporated Clark County, Nevada, and is surrounded by the City of Henderson (COH). The NERT RI Study Area is divided into three Operable Units (OUs), as shown in Figure ES-2. This OU-1 Refined SLERA is provided to evaluate whether constituents from the NERT Site Study Area pose a potential risk to ecological receptors in OU-1.

OU-1 Refined SLERA Approach

This OU-1 Refined SLERA was conducted consistent with the OU-1 Refined SLERA Work Plan, Revision 2, dated July 6, 2015 (Work Plan), and approved by the Nevada Division of Environmental Protection (NDEP) on August 15, 2015 (Ramboll Environ 2015; NDEP 2015). The OU-1 Refined SLERA follows the basic procedures outlined by the NDEP SLERA guidance and United States Environmental Protection Agency (USEPA) risk assessment guidance, as listed in Section 1.1. The objectives of this OU-1 Refined SLERA were to determine which one of the following is applicable:

1. The available data are adequate to conclude that constituents present from historical manufacturing activities do not pose an unacceptable risk to ecological receptors in the OU-1 Refined SLERA Area, and, therefore, there is no need for additional ecological risk assessment (ERA) (i.e., adequate information to conclude that the ecological risks are negligible, and no additional investigation of ecological risk is recommended).
2. Estimated ecological risks are not negligible, but the information is insufficient to indicate that adverse ecological effects are occurring. This may require a baseline ecological risk assessment (BERA).
3. Constituents associated with historical manufacturing activities within OU-1 have the potential to pose unacceptable ecological risks to ecological resources within the OU-1 Refined SLERA Area (i.e., there are sufficient lines of evidence to document potential or actual adverse ecological effects; recommendations may involve further investigation and/or interim action).
4. There is not adequate information to make a risk management decision due to high levels of uncertainty or incomplete information, whereupon the ERA process should continue beyond this screening-level evaluation and a plan to collect additional data should be guided by the refined SLERA.

A tiered approach was used in this OU-1 Refined SLERA that includes "screening" and "refined" scenarios to evaluate the range of potential risks, which is consistent with USEPA and NDEP guidance (USEPA 1997, 1998; NDEP 2006). The screening steps (Steps 1 – 2 of the USEPA's eight-step ERA process; USEPA 1997) are conservative analyses designed to examine potential risks in an overly protective fashion. A refined SLERA consists of Steps 1-3a of USEPA's eight-step ERA process allowing for a more realistic evaluation of potential risk. Within the USEPA eight-step process, Step 3a is considered a refined screening and is considered the initial part of the baseline ERA. The USEPA Steps 1 to 3a in general align

with the NDEP SLERA guidance (NDEP 2006). The most conservative screening (Steps 1 and 2) provided for OU-1 are referred to as the Tier 1 screening. The refined evaluation of ecological risks (Step 3a) provided for OU-1 is referred to as the Tier 2 screening.

Consistent with the Work Plan, the OU-1 Refined SLERA evaluates only a portion of the total area of OU-1. The area evaluated though this Refined SLERA, herein referred to as the "OU-1 Refined SLERA Area", consists of the Operations Area and Parcel E, which is shown in Figures ES-3 and ES-4. The Operations Area has been divided into three ecological decision units (DU), as shown in Figure ES-4. The DU sub-areas were evaluated individually so that no chemicals are eliminated from the risk assessment process prematurely. These five, discrete spatial units are summarized below:

- Operations Area: An approximately 259-acre area owned and used by the Trust for its remediation efforts and its tenant, EMD Acquisition LLC (EMD), for the operation of its chemical manufacturing business. The Operations Area excludes Sale Parcels C, D, E, F, G and H (identified by Tronox LLC [Tronox], the former owner of the Site, as "Sale Parcels"). The Sale Parcels were identified as areas that were either generally undeveloped and/or were not likely to have been significantly impacted by current or former industrial activities. Most of the parcels have undergone remediation and all have been evaluated as part of a Health-Risk Assessment process. Sale Parcels C, D, and H have not been used by the Trust or its tenant since the inception of the Trust and are no longer owned by the Trust (sold on May 8, 2020). Subsequently, Parcels F and G, which also have not been used by the Trust or its tenant since the inception of the Trust, were sold by the Trust on June 15, 2023. With the exception of Parcel E, described further below, each of the Sale Parcels have been granted No Further Action (NFA) determinations by NDEP. Therefore, Sale Parcels C, D, F, G and H are not included in the OU-1 Refined SLERA.
- Ecological Decision Unit 1 (Eco DU-1; 132.7 acres): Includes the northern portion of the Operations Area. This DU is largely vacant except for office trailers, field staging areas, the on-site components of the NERT Groundwater Extraction and Treatment System (GWETS), roadways and utilities, the GW-11, former AP-6, Mn-1, and Mn-2 ponds,[1] the Leasehold debris pile, the Northern Retention Basin and the associated drainage channel, scattered non-operational railroad tracks, monitoring wells, and concrete block walls.
- Eco DU-2 (51.1 acres): Includes the southern portion of the Operations Area that includes the Unit Buildings and leach plant.
- Eco DU-3 (8.5 acres): Includes the central portion of the Operations Area, including the Central Retention Basin, which is located south of the former AP-5 Pond and former Beta Ditch.
- Parcel E (8.6 acres): Parcel E is a non-contiguous, 8.6-acre parcel located in the northwest corner of OU-1 and has not been used by the Trust but contains extraction wells associated with the groundwater extraction system operated by Olin, Stauffer,

[1] The GW-11 and Mn-2 ponds are currently active. The AP-6 pond was emptied in 2001 and is inactive and the Mn-1 pond has been relined and is actively used by EMD. A closure strategy is being developed for GW-11. Lined ponds Mn-1 and Mn-2 are within the EMD leasehold (in OU-1).

Syngenta, and Montrose (OSSM). This system was installed to capture groundwater contamination not associated with OU-1 or Trust operations.

The initial screening approach provided in Sections 2 and 3 of this report includes a conservative screening of maximum detected constituent concentrations in surficial soil. Soil data used in this refined SLERA consists of available surface soil analytical results that are representative of current conditions within the OU-1 Refined SLERA Area. Details regarding the OU-1 Refined SLERA dataset are provided in Section 2.1.5.1. Surface soil data from post-excavation sampling that represents current conditions were included. Excavation Control Areas (ECAs)[2] located in the interior of OU-1 contain no significant attractive features for wildlife, and therefore wildlife would not forage or nest there. As such, surface soil data within these ECAs were excluded from the OU-1 Refined SLERA. ECAs in the southern portion of Eco DU-1 and ECAs in Eco DU-2 and Eco DU-3 fall into this category. Those ECAs that are at or near the boundary of OU-1, adjacent to areas outside of OU-1 that contain vegetation in open spaces where wildlife may be present, were considered in the OU-1 Refined SLERA. ECAs in the northern portion of Eco DU-1 fall into this category. Therefore, surface soil data from ECAs within the northern portion of Eco DU-1 were retained for the refined SLERA (Figure ES-4). All surface soil data available for Parcel E was also included in the OU-1 Refined SLERA. The areas included or excluded from the OU-1 Refined SLERA are discussed in detail in Section 2.

Maximum detected constituent concentrations in surficial soil were identified as exposure point concentrations (EPCs) for the screening in this OU-1 Refined SLERA. The use of the maximum constituent concentrations in soils in the screening is highly protective because it assumes that all ecological receptors spend their entire life within the boundaries of the OU-1 Refined SLERA Area where the maximum concentrations were detected, even if that area contains no habitat for ecological receptors and even if ecological receptors wander in and out of the OU-1 Refined SLERA Area boundaries.

Maximum detected concentrations were identified for the following chemical groups:

- Chlorine oxyanions
- Dioxins and furans
- Metals
- Organochlorine and organophosphate pesticides
- Radionuclide compounds
- Polychlorinated biphenyls (PCBs)
- Polycyclic aromatic hydrocarbons (PAHs)
- Semi-volatile organic compounds (SVOCs)
- Total petroleum hydrocarbons (TPH)
- Volatile organic compounds (VOCs)

Chemical mixtures were also considered because mixtures can influence ecotoxicity, as follows:

- Dioxin and furan mixtures were estimated using the toxic equivalent quotient (TEQ) approach for mammals and birds, using World Health Organization (WHO) equivalency factors and consistent with USEPA guidance.
- PAH mixtures are addressed as high molecular weight PAHs, low molecular weight PAHs, and total PAHs.

[2] ECAs were established in areas where soil remediation could not be completed due to access constraints.

- Pesticide mixtures for dichlorodiphenyltrichloroethane (DDT) and isomers are summed to combined exposures, represented as sum of combined DDT and isomer exposures (DDx).

Conservatively protective ecological screening values (ESVs) were identified for use in the screening. These ESVs were obtained from USEPA and other sources that reflect protection of terrestrial plants, soil invertebrates, birds, reptiles, and mammals. These conservatively protective ESVs reflect no adverse impacts to ecological receptors. All ecological receptors that may occur within or venture into the OU-1 Refined SLERA Area were assumed to be as sensitive to the constituents as the most sensitive organisms used to develop the ESVs.

Screening risk estimates were calculated in this OU-1 Refined SLERA by dividing maximum surface soil concentrations by the most conservative constituent-specific soil ESVs. These unitless constituent-specific ratios are referred to as hazard quotients (HQs). HQs less than or equal to a value of 1 (to one significant figure) indicate that adverse impacts to wildlife are considered unlikely (USEPA 1997). An HQ greater than 1 is an indication that further evaluation may be necessary to evaluate the potential for adverse impacts to wildlife.

The results of the initial screening using maximum detected concentrations are provided in Section 3 of this report and indicated:

- Many chemicals were either not detected or were detected at concentrations less than the conservative ESVs, and as such, the HQs were less than the threshold value of 1. Chemicals with concentrations below ESVs were excluded from further consideration in the refined SLERA.
- Many chemicals were detected but lack ESVs that are needed to calculate HQs. These chemicals are evaluated in the Uncertainty Assessment (Section 4.7).
- Some chemicals that are not detected have sample quantitation limits (SQLs) that exceed ESVs. These chemicals are further discussed in the Uncertainty Assessment (Section 4.7).[3]
- Some chemicals were detected at concentrations consistent with or below background. These chemicals are excluded from further consideration as described in Section 3.

The initial screening with maximum detected concentrations did identify a broad suite of chemicals with HQs exceeding 1 and with detected concentrations greater than background. These chemicals were retained for further consideration in the refined screening Step 3a presented in Section 4 of this report, since potential ecological risks from the initial screening (with maximum detected concentrations) could not be ruled out.

Step 3a Refined Screening Approach

Chemical of potential ecological concern (COPECs) identified following the initial screening were evaluated further in the refined screening using more realistic assumptions and values, as presented in Section 4 of this report. The following refinements were considered:

[3] Constituents not detected are not retained for quantitative evaluation in the refined screening Step 3a of this report (Section 4). However, these constituents are discussed as part of the uncertainty assessment in this report, consistent with the OU-1 Refined SLERA Work Plan (Ramboll Environ 2015).

- Refined screening using 95 percent upper confidence level of the mean (95% UCL) EPCs – Exposure in the refined evaluation considered the 95% UCL and average (AVG) concentrations as conservative yet more realistic measurements of how the receptors are exposed to COPECs.
- Refined ESVs to evaluate plant and soil invertebrate community via direct contact exposures – A range of ESVs were used that are specific to plants and soil invertebrates, not just the lowest among all ESVs, thereby refining the risk estimates to focus specifically on plants and invertebrates. ESVs for no effects and some refined screening values (RSVs) that reflect potential low effects were used.
- Identification and evaluation of bioaccumulative constituents – Food web modeling was used for higher trophic level species (birds and mammals) potentially susceptible to compounds that bioaccumulate through the food chain. The food web model includes maximum and central tendency (95% UCL and AVG) exposure concentrations for four bird species and five mammal species that may live and forage in the OU-1 Refined SLERA Area. The food web model was performed using no observable adverse effect level (NOAEL) and lowest observable adverse effect level (LOAEL) toxicity reference values (TRVs) for birds and mammals. The results of the evaluation for birds and mammals were used to estimate risks to reptiles. There is no habitat for amphibians within the OU-1 Refined SLERA Area; therefore, amphibians are not included in the OU-1 Refined SLERA.
- The food web model considers the amount of time a receptor would realistically be within the OU-1 Refined SLERA Area. This incorporates receptor-specific information about how their home ranges may overlap with OU-1 and whether they migrate out of the area for part of the year. Both conservative area use (100% of their time only within OU-1) and species-specific area use based on wildlife home ranges were used in the food web model.
- The species selected for the food web model represent herbivorous, omnivorous, insectivorous, and carnivorous feeding (i.e., trophic) guilds within the food web. The specific species evaluated in this OU-1 Refined SLERA include:

○ Cooper's Hawk	○ Great Basin Pocket Mouse
○ Western Burrowing Owl	○ Fringed Myotis
○ American Robin	○ Desert Shrew
○ Mourning Dove	○ Kit Fox
	○ Raccoon

In the screening refinement, 95% UCLs, a range of ESVs and RSVs for plants and invertebrates, and the bioaccumulation of chemicals through food web modeling for birds and mammals were generated for each of the five spatial units. This allowed the refined SLERA to consider how the receptors are actually exposed in a particular area and if habitat for those receptors actually exists in that area.

Results for the Assessment of the Plant and Soil Invertebrate Community

The findings from the plant and invertebrate-specific evaluation within the OU-1 Refined SLERA Area are summarized as follows:

- The majority of chemicals are not present at concentrations that pose an unacceptable risk to the plant and soil invertebrate community.
- Perchlorate and manganese may pose unacceptable risks to terrestrial plants and invertebrates based on RSVs and in consideration of 95% UCL LOAEL HQs.
- The potential risk to plants is most prevalent in Eco DU-1 and Eco DU-3 from exposure to perchlorate and in Eco DU-1 from exposure to manganese.
- The potential risk to invertebrates is most prevalent in Eco DU-1 and Eco DU-3 from exposure to perchlorate and in Eco DU-1 from exposure to manganese.

Results for the Assessment of the Bird and Mammal Populations

The food web model results were reported in a stepwise fashion from the most conservative to the most realistic input values and assumptions. The most realistic scenario reports HQs using the 95% UCL soil concentrations compared to LOAEL TRVs and species-specific habitat ranges, referred to as area use factors (AUFs). It is the results from the most realistic evaluation that should be used to make remedial decisions within the OU-1 Refined SLERA Area because these are the results that most accurately identify potential areas of risk, both spatially and by receptor. The risk evaluation for birds and mammals showed that:

- Most chemicals are not present at concentrations that pose an unacceptable risk to bird and mammal populations.

The birds and mammals at greatest risk are the insect eating birds and mammals, reflected by food web modeling for the desert shrew and American robin. Using the 95% UCL LOAEL HQs and species-specific AUFs, potential risk to the desert shrew and American robin from exposure to perchlorate and dioxins/furans is most prevalent in Eco DU-1 and Eco DU-3 (HQs ranging from 2 to 7).

OU-1 Refined SLERA Conclusions

Overall, the OU-1 Refined SLERA showed that most chemicals are not present at concentrations that would pose unacceptable risks to plants, soil invertebrates, birds, and mammals particularly in Eco DU-2 and Parcel E. Because of the paucity to toxicity data for reptiles, potential risks to this organism group are uncertain but if results from birds and mammals are extended to reptiles than this organism group would also not likely be exposed to unacceptable risks. The uncertainties involved with extrapolating bird and mammal risk results to reptiles is further evaluated in the uncertainty assessment (Section 4.7).

For those chemicals with HQs less than the threshold value of 1, the available data are adequate to conclude that constituents present from industrial activities do not pose an unacceptable risk to ecological receptors in the OU-1 Refined SLERA Area, and, therefore, there is no need for further action based on ecological risk.

This Refined SLERA demonstrated that Tier 1 HQs were less than 1 for many of the constituents detected, even when maximum concentrations were considered in comparison to the lowest ESVs for any ecological receptor (plants, soil invertebrates, birds, or

mammals). The constituents with HQs that exceeded a value of 1 in the initial Tier 1 screening (maximum concentrations and lowest ESVs) were retained for the refined SLERA analyses (i.e., the Tier 2 screening – Step 3a of USEPA ERA eight-step process), which included refined TRVs for plants, soil invertebrates, birds, and mammals The Tier 1 and Tier 2 evaluations provided adequate information to conclude that with limited exceptions discussed further below, ecological risks were negligible for PAHs, SVOCs, VOCs, PCBs, radionuclides, most of the pesticides, and most of the metals. Based on NDEP guidance (NDEP 2006), no additional evaluation is needed for constituents, ecological receptors, and ecological pathways with negligible ecological risks.

The constituents with Tier 2 HQs exceeding a value of 1 that are bioaccumulative include perchlorate, dioxin/furan TEQ, certain metals, certain pesticides, and PCBs. Using NDEP and USEPA guidance (USEPA 1997; NDEP 2006), each of these constituents were evaluated and discussed in terms of the bioaccumulation approach used (i.e., the food web model) and the uncertainties associated with background data, frequency of detection, derivation of the TRVs and screening values, and the interpretation of results within the context of the conceptual site model (CSM) of potential future exposures based on land use and the potential for organisms to encounter multiple chemicals in the environment of the OU-1 Refined SLERA Area. Based on these findings, the refined SLERA supports the conclusion that some potential ecological risks cannot be definitively ruled out, but no additional ERA is deemed necessary because:

- The Operations Area within the OU-1 Refined SLERA Area is a chemical manufacturing facility that will remain industrial in the future. Currently, ecological exposures are limited given the limited habitat present on Site.
- The food web model 95% UCL LOAEL HQs exceeded a value of 1 for the insect eating wildlife but did not exceed a value of 1 for herbivorous, omnivorous, and carnivorous birds and mammals (i.e., no unacceptable risks for the Cooper's hawk, kit fox, fringed bat, raccoon, mourning dove, and pocket mouse). Many of the 95% UCL NOAEL HQs for these wildlife receptors were also less than 1.
- With the food web model:
    - All of the 95% UCL LOAEL HQs from the food web model are below a value of 7.
    - The 95% UCL LOAEL HQs using species specific AUFs for the American robin and desert shrew ranged from 2 to 4 in the Operations Area, 1 to 5 in Eco DU-1, and2 to 7 in Eco DU-3.
    - Eco DU-2 and Parcel E did not have any 95% UCL LOAEL HQs greater than 1.
    - The 95% UCL LOAEL HQs are the most appropriate to use for the OU-1 Refined SLERA Area given that OU-1 offers little ecological habitat, and the area is used for industrial purposes (i.e., the ground is compacted, and little plant cover is present, so few ecological exposures will occur).
    - The food web model is considered likely to overestimate exposure and risk for the insect eating wildlife owl, robin, and shrew. This is because the literature values used to estimate uptake via the food web are considered likely biased high.

- A detailed uncertainty assessment is provided, including discussion of constituents lacking ESVs, chemicals not detected that have SQLs greater than ESVs, the use of TRVs, and uncertainties in the background evaluation.

Therefore, and in accordance with NDEP and USEPA guidance, the available SLERA results and data are adequate to inform risk management decisions as part of the Feasibility Study for OU-1. Further ecological risk analysis is unlikely to provide additional and/or differing information that would otherwise alter this conclusion.

1. INTRODUCTION

This refined Screening-Level Ecological Risk Assessment (Refined SLERA) Report, Revision 2, was prepared by Ramboll Americas Engineering Solutions, Inc. (Ramboll) on behalf of the Nevada Environmental Response Trust (NERT or the Trust) for Operable Unit 1 (OU-1) of the NERT Remedial Investigation (RI) Study Area. The Refined SLERA Report for OU-1, Revision 0 was submitted to the Nevada Division of Environmental Protection (NDEP) on August 6, 2021 (Ramboll 2021a), and NDEP comments were received on March 2, 2022 (NDEP 2022). NERT provided a response to comments on May 13, 2022 and NDEP provided clarifying comments on August 26, 2022. Revision 1 of the Refined SLERA Report for OU-1 was submitted to NDEP on April 20, 2023 (Ramboll 2023a), and NDEP comments on Revision 1 were received on June 8, 2023 (NDEP 2023a). This Revision 2 of the Refined SLERA Report for OU-1 was prepared to address the additional NDEP comments.

OU-1, also referred to as the NERT Site Study Area, is located within the BMI[4] Complex in unincorporated Clark County and is surrounded by the City of Henderson (COH), Nevada (Figures 1-1 and 1-2a). The Black Mountain Industrial (BMI) Complex is a heavy industrial area currently operated by multiple entities. The OU-1 Refined SLERA was conducted as part of the RI and was performed to evaluate whether chemicals in soil within OU-1 pose a potential risk to ecological receptors that may enter the NERT Site Study Area. Ecological Risk Assessments (ERAs) are being prepared for each of the three OUs in the NERT RI Study Area, which are shown on Figure 1-2a, as follows:

- OU-1 encompasses the NERT Site Study Area,[5] which comprises approximately 346 acres located within the current BMI Complex. OU-1 has been the location of industrial operations since 1942 when it was developed by the United States (US) Government as a magnesium plant to support World War II operations. OU-1 includes Parcels C, D, E, F, G, and H; however, only Parcel E is included in this refined SLERA consistent with the Refined SLERA Work Plan, Revision 2 (Work Plan) dated July 6, 2015 (Ramboll Environ 2015) and approved by the NDEP on August 15, 2015 (NDEP 2015).
- OU-2 comprises approximately 2,645 acres and includes the NERT Off-Site Study Area component of OU-2 located west of Pabco Road and the Eastside Sub-Area component of OU-2 located east of Pabco Road. Much of the Eastside Sub-Area was historically part of the BMI Common Areas, which are rapidly being redeveloped, primarily for residential use, as part of a master planned community. To the west of Pabco Road, the NERT Off-Site Study Area within OU-2 is used for residential,

[4] The acronym "BMI" has been applied to several entities over the years. From 1941 until 1951, it referred to Basic Magnesium Incorporated; in 1951, a syndicate of tenants formed under the name Basic Management, Inc., to provide utilities and other services at the complex; the group has also been known as Basic Metals, Inc., and at the present is called the BMI Complex.

[5] The original "NERT Site Study Area" area was established as part of the original NERT RI/FS Work Plan in 2012 where it was referred to as simply the "NERT Site." The NERT Site and OU-1 occupied the same area prior to May 8, 2020, when Sale Parcels C, D, and H were sold by the Trust. Subsequently, Parcels F and G were sold by the Trust on June 15, 2023. Within this report the terms "NERT Site" or "Site" refer to property owned by the Trust after June 15, 2023. The term "OU-1" refers to the area inclusive of the "NERT Site" as well as Sale Parcels C, D, F, G, and H.

commercial, and light industrial purposes, unaffiliated with operations at the NERT Site or the BMI Complex.

- OU-3 comprises approximately 2,200 acres and includes the Northeast Sub-Area, the Downgradient Study Area which encompasses a portion of the Las Vegas Wash, and the northern portion of the NERT Off-Site Study Area. The OU-3 area is primarily residential property featuring a golf course east of Pabco Road, land that is currently being rapidly developed as part of a master planned community, and undeveloped Bureau of Reclamation land. In addition, the COH operates a water reclamation facility west of Pabco Road within OU-3, which includes the COH Bird Viewing Ponds.

As previously discussed and detailed in the RI Report for OU-1 and OU-2 (Ramboll 2023b), the NERT Site Study Area has been the location of industrial operations since 1942 when it was developed by the U.S. Government as a magnesium plant to support World War II operations. Following the war, the NERT Site Study Area continued to be the location of industrial activities, including production of perchlorates, boron, and manganese compounds. Former industrial and waste management activities conducted within the NERT Site Study Area, as well as those conducted at adjacent properties, resulted in contamination of environmental media, including soil, soil gas, groundwater, and surface water. A site vicinity land use map is provided in Figure 1-2b.

An ERA is defined as a process that evaluates the likelihood that adverse ecological effects may occur or are occurring as a result of exposure to one or more stressors. A risk does not exist unless (1) the stressor has the inherent ability to cause one or more adverse effects and (2) it co-occurs with or contacts an ecological component (i.e., organisms, populations, communities, or ecosystems) long enough and at sufficient intensity to elicit the identified adverse effect. A typical SLERA consists of Steps 1 and 2 of United States Environmental Protection Agency's (USEPA's) eight-step ERA process (USEPA 1997) and primarily consists of comparing maximum chemical concentrations at a site to the most protective ecological screening value (ESV) in a highly conservative evaluation of potential risk. Highly conservative risk values and assumptions are used consistent with USEPA guidance (USEPA 1997, 1998). A refined SLERA includes the addition of Step 3a, which allows for a more realistic evaluation of potential risk (USEPA 1997). This Refined SLERA has been conducted for the OU-1 Refined SLERA Area (further defined below) using the methodology detailed in the Work Plan.

Figure 1-2c depicts the current Site features within the entirety of OU-1; whereas Figure 1-2d depicts the subject area of this Refined SLERA. As presented in the Work Plan, this area is comprised of the Operations Area and Sale Parcel E and is referred to herein as the OU-1 Refined SLERA Area. From an ecological standpoint, the OU-1 Refined SLERA Area is devoid of quality habitat, is completely fenced in, and is generally barren of vegetation with bare soil as the primary feature. A reconnaissance inspection of the OU-1 Refined SLERA Area, conducted by a senior ecologist from Ramboll in December 2014 and confirmed in June 2020, evaluated the ecological resources of the OU-1 Refined SLERA Area in accordance with USEPA guidance (USEPA 1997). The results of the inspection were documented in the USEPA Completed Ecological Site Reconnaissance Checklist, provided in Appendix A. Photos that illustrate the lack of habitat are presented in Appendix B.

As indicated, the OU-1 Refined SLERA Area consists of the Operations Area and Parcel E within OU-1 as shown in Figure 1-2d. Sale Parcels C, D, F, G, and H have been sold by the

Trust and are therefore excluded from the OU-1 Refined SLERA Area. The Operations Area was divided into three ecological decision units (DUs), as shown in Figure 1-3. The DU sub-areas were evaluated individually so that no chemicals are eliminated from the risk assessment process prematurely. The five spatial DUs include (1) the Operations Area that consists of Eco DU-1, Eco DU-2, and Eco DU-3, (2) Eco DU-1, (3) Eco DU-2, (4) Eco DU-3, and (5) Parcel E. These five spatial units are summarized below:

- Operations Area: An approximately 259-acre area owned and used by the Trust for its remediation efforts and its tenant EMD Acquisition LLC (EMD) for the operation of its chemical manufacturing business. The Operations Area excludes Sale Parcels C, D, E, F, G, and H (identified by Tronox LLC [Tronox] as "Sale Parcels"). The Sale Parcels were identified as areas that were either generally undeveloped and/or were not likely to have been significantly impacted by current or former industrial activities. Each of the parcels have been evaluated as part of a Health-Risk Assessment process. There has been minor soil remediation via excavation and disposal performed in Parcel C in February 2017 (Ramboll Environ 2017). Sale Parcels C, D, and H have not been used by the Trust or its tenant since the inception of the Trust in 2011 and are no longer owned by the Trust as of May 8, 2020. Subsequently, Parcels F and G, which also have not been used by the Trust or its tenant since the inception of the Trust, were sold by the Trust on June 15, 2023. With the exception of Parcel E, described further below, each of the Sale Parcels have been granted No Further Action (NFA) determinations by NDEP. Therefore, Sale Parcels C, D, F, G, and H are not included in the OU-1 Refined SLERA or the OU-1 Refined SLERA Area.
- Ecological Decision Unit 1 (Eco DU-1; 132.7 acres): Includes the northern portion of the Operations Area. This DU is largely vacant with the exception of office trailers, field staging areas, the on-site components of the NERT Groundwater Extraction and Treatment System (GWETS), roadways and utilities, the GW-11, AP-6, Mn-1, and Mn-2 ponds[6], the Leasehold debris pile, the Northern Retention Basin and the associated drainage channel, scattered non-operational railroad tracks, monitoring wells, and concrete block walls.
- Eco DU-2 (51.1 acres): Includes the southern portion of the Operations Area that includes the Unit Buildings and EMD's leach plant. The Unit Buildings were constructed in 1942 by the US Government for the manufacturing of magnesium and later converted to support other manufacturing processes. The Excavation Control Area (ECAs) are areas where soil contamination is known to exist and were not cleaned up as part of a soil removal action completed in 2010 and 2011. The ECAs in Eco DU-2 are not included in the OU-1 Refined SLERA as described in detail in Section 2.1.
- Eco DU-3 (8.5 acres): Includes the central portion of the Operations Area, including the Central Retention Basin, which is located south of the former AP-5 Pond, and former Beta Ditch.

[6] The GW-11 and Mn-2 ponds are currently active. The AP-6 pond was emptied in 2001 and is inactive and the Mn-1 pond has been relined and is actively used by EMD. A closure strategy is being developed for GW-11. Lined ponds Mn-1 and Mn-2 are within the EMD leasehold (in OU-1).

- Parcel E (8.6 acres): Parcel E is a non-contiguous, 8.6-acre parcel located in the northwest corner of OU-1 and has not been used by the Trust but contains extraction wells associated with the groundwater extraction system operated by Olin, Stauffer, Syngenta, and Montrose (OSSM). This system was installed to capture groundwater contamination not associated with former operations at the Trust site.

The BMI Complex facilities surrounding OU-1 including major land ownership in the NERT RI Study Area are shown in Figure 1-4. The NERT Site Study Area and surrounding area has been the subject of numerous regulatory actions and environmental investigations since the early 1970s. A chronological summary of investigations and remedial activities conducted in OU-1 is presented within Section 2 of the RI Report for OU-1 and OU-2 (Ramboll 2023b). The RI Report for OU-1 and OU-2 also provides a detailed description of the operational history, physical setting, climate, geology, and hydrogeology within the NERT RI Study Area. Parcel E was identified for possible sale early in the environmental investigation process. A human health risk assessment (HRA) for Parcel E was first submitted to NDEP on November 18, 2022 (Ramboll 2022) and NDEP provided comments on February 8, 2023. A revised HRA for Parcel E and the Trust's annotated responses to NDEP's comments were submitted on November 17, 2023 (Ramboll 2023c). Upon NDEP approval of the HRA for Parcel E, the Trust will request an NFA determination from NDEP.

1.1 Refined SLERA Objectives and Approach

This OU-1 Refined SLERA was conducted consistent with the Work Plan. The refined SLERA follows the basic procedures outlined by the NDEP ERA guidance and USEPA risk assessment guidance, as listed below. The objectives of this OU-1 Refined SLERA were to determine which one of the following is applicable:

1. The available data are adequate to conclude that constituents present from historical manufacturing activities do not pose an unacceptable risk to ecological receptors in the OU-1 Refined SLERA Area, and, therefore, there is no need for additional ERA (i.e., adequate information to conclude that the ecological risks are negligible, and no additional investigation of ecological risk is recommended).
2. Estimated ecological risks are not negligible, but the information is insufficient to indicate that adverse ecological effects are occurring. This may require a baseline ecological risk assessment (BERA).
3. Constituents associated with historical manufacturing activities within OU-1 have the potential to pose unacceptable ecological risks to ecological resources within the OU-1 Refined SLERA Area (i.e., there are sufficient lines of evidence to document potential or actual adverse ecological effects; recommendations may involve further investigation and/or interim action).
4. There is not adequate information to make a risk management decision due to high levels of uncertainty or incomplete information, whereupon the ERA process should continue beyond this screening-level evaluation and a plan to collect additional data should be guided by the refined SLERA.

The OU-1 Refined SLERA was conducted consistent with the following key USEPA ERA guidance documents:

- NDEP guidance: SLERA Guidelines for the BMI Complex, Henderson, Nevada (NDEP 2006)

- Ecological Risk Assessment Guidance for Superfund: Process for Designing and Conducting Ecological Risk Assessments (USEPA 1997)
- Guidelines for Ecological Risk Assessment (USEPA 1998)
- SLERA Protocol for Hazardous Waste Combustion Facilities (USEPA 1999a)
- ECO-Update: Role of Screening-Level Risk Assessments and Refining Contaminants of Concern in BERA (USEPA 2001)
- Weight of Evidence in Ecological Risk Assessment (USEPA 2016a)
- Generic Ecological Assessment Endpoints for Ecological Risk Assessment (USEPA 2016b)

A tiered approach was used in this OU-1 Refined SLERA that includes "screening" and "refined" scenarios to evaluate the range of potential risks. The screening steps (Steps 1 – 2 of the USEPA's eight-step ERA process; USEPA 1997) are the first Tier consisting of a conservative analysis designed to examine potential risks in an overly protective fashion. A refined SLERA consists of Steps 1-3a of USEPA's eight-step ERA process. Step 3a allows for the refinement of the highly conservative assumptions used in Steps 1 and 2 using available, and often more realistic, toxicological information and parameters. While the screening is generally consistent with Steps 1 and 2 of USEPA's eight-step ERA process, NDEP's SLERA Guidelines for the BMI Complex (NDEP 2006) allows for several additional tools to reduce the dataset and focus on the chemicals within the OU-1 Refined SLERA Area that are truly contributing to risk. This information is described in detail in Section 2.1.5 and illustrated in Figures 1-5 and 1-6.

The USEPA process requires scientific management decision points (SMDPs) following certain steps, as shown on Figure 1-6. The SMDPs represent critical steps in the ERA process where NERT and its beneficiaries' input and decision making can occur. If potentially adverse effects are identified, the iterative risk assessment process continues with Steps 3b through 8 or a BERA.

The following types of decisions may be considered at a SMDP:

- Whether the available data are adequate to conclude that historical industrial activities do not pose an unacceptable risk to ecological receptors that may venture into the OU-1 Refined SLERA Area, and, therefore, there is no need for further action based on ecological risk.
- Whether the available information is not adequate to make a decision, whereupon the ERA process should continue (Steps 3b – 8).
- Whether the available information indicates a potential for an adverse ecological effect, and a more thorough assessment or remediation is warranted.

1.2 Refined SLERA: Steps 1 – 3a of the Eight Step USEPA Risk Assessment Process

The remainder of this OU-1 Refined SLERA describes in detail the specific elements of Steps 1 through 3a as they were implemented for the OU-1 Refined SLERA Area. The SMDP following Step 3a identifies whether there is a need to proceed to later steps of the ERA process (e.g., Steps 3b through Step 8) (Figure 1-5).

The screening scenario which involves Steps 1 – 2 of the ERA Process are provided in Sections 2 and 3 of this report and involves the following assumptions:

- The maximum concentrations in the abiotic media (e.g., soil) was used to quantify risk to ecological receptors. Therefore, the receptors of concern were assumed to be exposed to only the maximum concentrations within the OU-1 Refined SLERA Area, rather than the actual range of concentrations.
- Conservative ESVs were used. The receptors of concern were assumed to be as sensitive to the constituents as the most sensitive organisms.
- It was assumed that the ecological receptors spend their entire life within the boundaries of the OU-1 Refined SLERA Area where the maximum concentration was detected, even if that area contains no habitat for that particular receptor.
- The refined scenario which involves Step 3a of the USEPA's eight-step ERA Process is provided in Section 4 of this report and involves the following assumptions:
    - The concentrations in the refined scenario considered the 95 percent upper confidence limit of the mean (95% UCL) and the average (AVG) concentrations as conservative yet more realistic measurements of how the receptors are actually exposed to constituents of potential ecological concern (COPECs).
    - A range of screening values for abiotic media, as well as toxicity values are used. This considers a broader array of potential effects on the receptors.
    - A food web model is used that considers the amount of time that a receptor would realistically be within the OU-1 Refined SLERA Area. This incorporates receptor-specific information about how their home ranges may overlap with the OU-1 Refined SLERA Area and whether they migrate out of the area for part of the year.

Based on the OU-1 reconnaissance efforts by a certified biologist in December 2014, there is little or no habitat in the OU-1 Refined SLERA Area that provides nesting or foraging opportunities for wildlife. OU-1 has been visited on four additional occasions by a certified biologist including as recently as June 2020. While there have been some physical changes (e.g., closure of the AP-5 Pond, installation of additional wells, and limited soil excavation activities) since 2014, the alterations have not added potential habitat for ecological receptors. Without habitat to attract wildlife there is unlikely to be a significant pathway from the source of chemicals to the wildlife receptors of interest. However, because wildlife has been observed infrequently within the OU-1 Refined SLERA Area, it is considered prudent to conduct both a screening and a screening refinement using the approach described herein.

1.3 Refined SLERA Report Organization

The remainder of this report is organized as follows:

- Section 2 – Step 1: Screening-Level Problem Formulation and Ecological Effects Characterization
- Section 3 – Step 2: Screening-Level Exposure Assessment and Risk Calculation
- Section 4 – Step 3a: Refined Screening and Uncertainty Assessment
- Section 5 – OU-1 Refined SLERA Conclusions
- Section 6 – References

2. STEP 1: SCREENING-LEVEL PROBLEM FORUMULATION AND ECOLOGICAL EFFECTS CHARACTERIZATION

Step 1 of the refined SLERA involves the screening-level problem formulation (Section 2.1) and ecological effects evaluation (Section 2.2).

2.1 Screening-Level Problem Formulation

The purpose of the screening-level problem formulation is to describe the environmental setting at and adjacent to the OU-1 Refined SLERA Area and to provide a preliminary evaluation of ecological exposure pathways and assessment endpoints. The screening-level problem formulation provides the framework for the screening step and the methods for analyzing/characterizing risks (USEPA 1998).

The screening-level problem formulation produces two outputs: (1) assessment endpoints that reflect the management and ecosystem attributes the endpoints are meant to protect; and (2) an ecological conceptual site model (CSM) that is a written description and visual representation of predicted relationships between ecological entities and the stressors to which they may be exposed.

The problem formulation phase includes:

- A description and history of the OU-1 Refined SLERA Area
- A description of the environmental setting and the characterization of ecological habitats within the OU-1 Refined SLERA Area
- The identification of potentially exposed ecological receptors
- The identification of COPECs
- The identification of complete pathways by which ecological receptors could be exposed to COPECs
- The identification of assessment and measurement endpoints
- The development of a CSM

2.1.1 OU-1/NERT Site Study Area History

OU-1, also referred to as the NERT Site Study Area[7], is comprised of approximately 346 acres located within Sections 12 and 13 of Township 22 S, Range 62 E within the BMI Complex in unincorporated Clark County and is surrounded by the COH, Nevada. OU-1 and surroundings, including the current BMI Complex, are shown in Figures 1-2b and 1-4.

The historical information summarized in this section was obtained from the NERT RI Report for OU-1 and OU-2, which was submitted to NDEP in August 2023 (Ramboll 2023b). The BMI Complex, which includes the NERT Site Study Area, was initially developed by the U.S. Government as a magnesium production facility during World War II.

[7] The original "NERT Site Study Area" area was established as part of the initial NERT RI/FS Work Plan in 2012 where it was referred to as simply the "NERT Site." The NERT Site Study Area is identical to the OU-1 area, includes Sale Parcels C, D, F, G, and H, no longer owned by the Trust, and refers to the property owned by the Trust after February 14, 2011, and prior to May 8, 2020.

The NERT Site Study Area, which is part of the current BMI Complex, has been used for the manufacture and production of a variety of chemicals throughout its history. The BMI Complex area was first developed as a magnesium metal manufacturing facility during World War II with ten identical Unit Buildings, six of which (Unit Buildings 1-6) are within the boundaries of the NERT Site. The first production operations (for magnesium metal) began on August 31, 1942. Approximately 82,500 tons of magnesium metal were produced by Basic Magnesium within the entire BMI Complex (Unit Buildings 1-10) between 1942 and 1944. Process wastewater generated by industrial operations within the NERT Site Study Area and surrounding BMI Complex during this time was initially accumulated in the Trade Effluent ponds (partially located within OU-1). In the early 1940s, the Trade Effluent ponds were replaced by a series of unlined ditches leading to infiltration/evaporation ponds, referred to as the Upper and Lower BMI ponds, and located north and east of the current BMI Complex (located within OU-2 and OU-3). The Beta Ditch, an unlined conveyance cutting across the northern portion of OU-1, acted as a migration pathway for process effluent between the NERT Site Study Area and Upper BMI ponds from the 1940s until the 1970s. Other conveyances within the BMI Complex are described in detail within the NERT RI Report for OU-1 and OU-2 (Ramboll 2023b).

After World War II, the Basic Magnesium facility was repurposed, leased, and eventually sold to several chemical manufacturers. The portion that includes OU-1 was operated as primarily a perchlorate and chlorate manufacturing facility beginning in 1945, with the later addition of manganese dioxide (1951), elemental boron (1973), and boron trichloride (1973) operations, in addition to several other chemical products. Chemical production operations within OU-1 were historically operated by several different companies. The Western Electronic Chemical Company (WECCO) leased property from the government starting in 1945 before purchasing the Site in 1952. WECCO merged with the American Potash and Chemical Company (AP&CC) in 1955. Kerr-McGee Chemical Corporation (Kerr-McGee) acquired the NERT Site Study Area in 1967 following a merger with AP&CC. More than 900,000 tons of chlorate products and over 340,000 tons of perchlorate products were produced during its operational history. Much of the chlorate and perchlorate manufacturing process was conducted within Unit Buildings 4 and 5, as well as an area to the west of the former AP-5 Pond (Figure 1-2c). Process liquids associated with chlorate and perchlorate production, which also contained hexavalent chromium, were collected in the basement areas of Unit Buildings 4 and 5, resulting in subsurface soil and groundwater contamination via cracks in the concrete basement floor. Contamination also occurred via discharge to lined and unlined process water ponds, unlined wastewater conveyance ditches, and infiltration/evaporation ponds.

During the 1970s, the USEPA, the State of Nevada, and Clark County investigated potential environmental impacts from operations conducted within the BMI Complex, including atmospheric emissions, groundwater and surface water discharges, and soil impacts (ENSR 2007). From 1971 to 1976, Kerr-McGee modified their manufacturing process and constructed lined surface impoundments to recycle and evaporate industrial wastewater. Use of the Beta Ditch for process wastewater migration ceased in 1976 when each of the companies operating within the BMI Complex was required to implement zero discharge industrial wastewater management practices.

In 1980, the USEPA requested specific information from the BMI Complex companies regarding their manufacturing processes and their waste management practices.

Investigations of hexavalent chromium-impacted groundwater began in late 1983. Identification and cleanup of hexavalent chromium contaminated groundwater was initiated by Kerr-McGee based on a September 9, 1986, NDEP Consent Order. Treatment of hexavalent chromium in groundwater began in mid-1987 and is on-going today. In 1994, the NDEP issued a LOU identifying 69 specific areas[8] or items of interest and indicated the level of environmental investigation they wanted Kerr-McGee to conduct (NDEP 1994). A detailed discussion of the specific areas or items of interest identified in the LOU and a list of the products made, years of production, and approximate waste volumes for WECCO, AP&CC, and Kerr-McGee are found in the 2005 CSM document prepared by ENSR (ENSR 2005). Ultimately, the remedial investigation/feasibility study (RI/FS) and final remedy implementation will resolve any issues associated with the LOUs.

In 1997, perchlorate, later shown to originate from the NERT Site Study Area and the former American Pacific Corporation/Pacific Engineering and Production Company of Nevada (AMPAC/PEPCON) property, was detected in the Las Vegas Wash and the Colorado River (NDEP 2011). The perchlorate plume in shallow groundwater is illustrated in Figure 2-1. In 1999 and 2002, temporary groundwater treatment and extraction systems for removal of perchlorate were constructed within what is now OU-1 and near the Las Vegas Wash, respectively, as part of a removal action required by NDEP. The temporary treatment systems were replaced by a biological fluidized bed reactor treatment system located within OU-1, which has operated since 2004.

Kerr-McGee discontinued production of sodium chlorate and ammonium perchlorate in 1997 and 1998, respectively. In 2005, Kerr McGee spun off the chemical business and changed the name to Tronox. In 2009, Tronox filed for Chapter 11 bankruptcy. The Trust took title to what is now called OU-1 on February 14, 2011, as a result of the settlement of Tronox's bankruptcy proceeding. Tronox maintained a lease for a portion of the Site between 2011 and 2018, where it continued its manufacturing operations. EMD acquired Tronox's operations in 2018 and continues to produce manganese dioxide, elemental boron, and boron trichloride within a leased portion of the NERT Site Study Area.

2.1.1.1 Parcel E

Parcel E is a 8.6-acre parcel located in the northwest corner of OU-1 (Figure 1-2d). Environmental investigations in Parcel E have generally been conducted separately from investigations in the Operations Area. The only field investigation for soils in Parcel E was completed in 2018 as part of the Phase 2 RI Modification No. 12 (Ramboll 2018). Soil gas samples were collected within Parcel E in 2008, 2013, and 2019. Shallow groundwater monitoring is ongoing.

2.1.2 Environmental Setting

This section describes the regional ecology, climate, geology, and local hydrogeology in and around OU-1.

2.1.2.1 Regional Ecology

The regional ecosystem distribution and the predominant ecosystem types in the vicinity of the NERT RI Study Area are illustrated on Figure 2-2. The ecosystem type in this region of

[8] Subsequent to the identification of the LOUs, an additional potential source area within OU-1, the former US Vanadium site, was identified during planning for the Phase B 2008 investigation. Although not formally designated as a LOU, the US Vanadium site is commonly referred to as LOU-70.

southern Nevada is Mojave Desert scrub (Clark County Department of Comprehensive Planning 2000). The Mojave Desert scrub ecosystem includes creosote-bur sage and Mojave mixed scrub vegetation communities; invasive, transitional grasslands, as well as large tracts of urban development; small areas of barren land; and agricultural development.

2.1.2.2 Local Ecology

The USEPA ecological checklist was completed during the OU-1 reconnaissance in December 2014 and is provided in Appendix A. The ecological conditions within the OU-1 Refined SLERA Area were confirmed as recently as June 2020. A photographic log of OU-1 and surroundings is provided in Appendix B. The checklist includes the following types of information:

- Site operations relevant to potential ecological risk (i.e., impacted soil, current and former process ponds, retention ponds, etc.)
- Land use / topography / impacted versus unimpacted areas
- Habitats, vegetation types, and biological communities
- The wildlife community (birds, mammals, and reptiles that may be present in the vicinity of the Site)
- The presence or absence of ecologically sensitive areas within OU-1

The NERT RI Study Area is located in a very arid region with few natural surface water bodies. Surface water within OU-1 is primarily present in the impoundments receiving (1) process wastewater within the EMD leasehold (known as WC-East, WC-West, Mn-1, and Mn-2 Ponds)[9] and (2) extracted groundwater prior to treatment (GW-11). The four lined ponds within the EMD leasehold (in OU-1) contain process-related sludge and/or water from ongoing EMD facility operations.[10] The Mn-1 pond was relined and returned to service in 2020 and the Mn-2 pond is largely full of process-related sludge with very little open water. The additional lined pond (GW-11) was constructed in 1998 to contain extracted contaminated groundwater and is currently used to hold untreated groundwater and well field diversions during GWETS maintenance and effluent quality diversions. GW-11 is also used as an equalization basin on occasion and a closure strategy for the pond is currently being developed. Each of these lined holding ponds are permitted through NDEP's Bureau of Water Pollution Control.

In addition to the impoundments, surface water in OU-1 is present as storm water runoff during storm events. During a 2011-2012 soil removal action, OU-1 was graded such that storm water would be retained on-site (ENVIRON 2012). Additionally, two retention basins (the Central Retention Basin and the Northern Retention Basin) with a connecting drainage channel were constructed to receive storm water (Figure 1-2c). Given the arid conditions in the region, the retention basins are typically dry except immediately after infrequent storm events. The shallow channel connecting the two retention basins conveys overflow from the Central Retention Basin into the Northern Retention Basin. Existing roads, utility berms,

[9] The WC-West and WC-East ponds have been referred to in prior reports as the WC-1 and WC-2 ponds, respectively. The Mn-1 pond has been inactive since the Mn-2 pond was constructed in 2013 but Mn-1 remains physically present (awaiting demolition).

[10] NERT has no oversight role with respect to EMD's facility operations, ponds, and associated permits.

and other features have inward grades designed to keep storm water from flowing outside of the NERT Site. Based on the surface areas and soil types, significant ponding is not expected to occur in these areas outside of major storm events. Surface runoff from on-site areas and a majority of water collected by the storm sewer network within the EMD-leased area is directed to the Central Retention Basin. Given the current topography along the western property boundary, there is the potential for a small volume of storm water to enter OU-1 from the west through surface flow, which is collected in topographic depressions on the Site and/or in the Central Retention Basin. Surface runoff from north of the former Beta Ditch is generally directed to the Northern Retention Basin.

Because the holding ponds are permitted as part of operations and do not discharge to groundwater that seeps to a surface water body, they are not included as potential exposure media in the refined SLERA as described in the Work Plan. Retention basins that capture storm water within the NERT Site are inundated only during large storm events and for very brief periods throughout the year. Aside from the five lined ponds and stormwater conveyance features described above, there are no other surface water features within OU-1 and therefore, surface soil is the only potential exposure media in the Operations Area and Parcel E, which constitute the OU-1 Refined SLERA Area.

2.1.2.3 Climate

The climate of the Las Vegas Valley is arid with mild winters and dry hot summers. Average annual precipitation as measured in Las Vegas between 1980 and 2020 was 4.2 inches (National Oceanographic and Atmospheric Administration [NOAA] 2021). Precipitation generally occurs during two periods: December through March and July through September. Winter storms typically produce low intensity rainfall over a large area. Summer storms generally produce high intensity rainfalls over a smaller area for a short duration. These violent summer thunderstorms account for most of the documented floods in the Las Vegas area. Winds frequently blow from the south or northwest at a mean velocity of approximately 9 miles per hour (mph); however, velocities in excess of 50 mph are not atypical when weather fronts move through the area. During these windy events, dust, sand, and soil at the ground surface can become airborne and may travel several miles. Temperatures can rise to 120°F in the summer, and the average relative humidity is approximately 20%. The mean annual evaporation from lake and reservoir surfaces ranges from 60 to 82 inches per year (Shevenell 1996).

2.1.2.4 Geology

The following subsections provide a summary of the regional geology, local geology, and local hydrogeology. A detailed description of the regional and local geology can be found in the RI Report for OU-1 and OU-2 (Ramboll 2023b).

Regional Geology

OU-1 is located within a topographic and structural basin trending northwest-southeast and extending approximately 55 miles from near Indian Springs on the north to Railroad Pass on the south. The valley in which OU-1 is located is bounded by the Las Vegas Range, Sheep Range, and Desert Range to the north; by Frenchman and Sunrise Mountains to the east; by the McCullough Range and River Mountains to the south and southeast; and the Spring Mountains to the west. The mountain ranges bounding the east, north, and west sides of the valley consist primarily of Paleozoic and Mesozoic sedimentary rocks (limestones, sandstones, siltstones, and fanglomerates), whereas the mountains on the south and

southeast consist primarily of Tertiary volcanic rocks (basalts, rhyolites, andesites, and related rocks) that overlie Precambrian metamorphic and granitic rocks (ENSR 2007; Ramboll 2023b).

Local Geology

The local geology and hydrogeology are defined by data collected from more than 2,000 borings and wells that have been installed in the area. The following descriptions are summarized from the RI Report for OU-1 and OU-2 (Ramboll 2023b).

Alluvium – The surface of OU-1 is primarily Quaternary alluvial deposits that slope north toward the Las Vegas Wash. The alluvium consists of a reddish-brown heterogeneous mixture of well-graded sand and gravel with lesser amounts of silt, clay, and caliche. Clasts within the alluvium are primarily composed of volcanic material. Boulders and cobbles are common. Due to the mode of deposition, no distinct beds or units are continuous over the area.

Transitional (or reworked) Muddy Creek Formation – Where present, the transitional Muddy Creek Formation (xMCf) is encountered at the base of the alluvium. The xMCf consists of reworked sediments derived from the Muddy Creek Formation, which is described below. Therefore, the xMCf appears similar to the Muddy Creek Formation, but it consists of reworked, less consolidated, and indurated sediments.

Muddy Creek Formation – The Muddy Creek Formation of Pleistocene age occurs in the Las Vegas Valley as valley-fill deposits that are coarse-grained near mountain fronts and become progressively finer-grained toward the center of the valley. Within OU-1, the Muddy Creek Formation does not crop out but instead subcrops beneath a veneer of Quaternary alluvium. Locally, the Muddy Creek Formation reaches thicknesses greater than 1,000 feet (ft) in Las Vegas Valley.

Locally, the Muddy Creek Formation represents deposition in an alluvial apron environment from the Spring Mountains to the west, grading into fluvial, paludal (swamp), playa, and lacustrine environments further out into the valley center. Subsurface investigation in the RI Study Area has been focused on characterization of the alluvium and the Muddy Creek Formation to depths of approximately 300-400 ft. Therefore, the Muddy Creek Formation has been informally termed the Upper Muddy Creek Formation (UMCf) in this area. Since OU-1 is located closer to the mountains, the upper portion of the UMCf fine-grained facies unit tends to have zones of sandy silt/silty fine sand as well as a greater number of thin, discontinuous layers of silty sand than in OU-2, which is farther from the mountains and more toward the interior of the depositional basin.

2.1.2.5 Local Hydrogeology

Within OU-1, first groundwater is generally encountered between 30 and 45 ft below ground surface (bgs) and tends to be deepest in the southern portion of the NERT Site. Within OU-2, north of Warm Springs Road, groundwater is generally encountered between 20 and 60 ft bgs, becoming as shallow as 6.4 ft bgs in the northwest portion of OU-2 just south of Sunset Road based on groundwater depth measurements collected on February 24, 2021. Within OU-3, groundwater is generally encountered between 5 and 35 ft bgs, becoming shallower to the north and occurring near the ground surface at the Las Vegas Wash. The groundwater flow direction within OU-1 is generally north to north-northwest, whereas within OU-2 and OU-3 the direction changes slightly towards the north-northeast.

Groundwater is not considered in this OU-1 Refined SLERA because wildlife is not exposed to groundwater due to its depth below the ground surface (greater than 40 ft bgs).

NDEP has defined three water bearing zones (WBZs) that are of interest in the BMI Complex, including the Shallow WBZ, Middle WBZ, and the Deep WBZ. The Shallow WBZ is defined by the first occurrence of groundwater in either the Quaternary alluvium, xMCf, or the UMCf where the xMCf is missing, is unconfined to partially confined, and is considered the "water table aquifer." The Middle WBZ extends from approximately 90 to 300 ft bgs. The Deep WBZ is defined as the contiguous WBZ that is generally encountered between 300 to 400 ft bgs (NDEP 2009a).

The Shallow WBZ comprises the saturated portions of the alluvium and the uppermost portion of the UMCf to a depth of approximately 90 ft bgs. The alluvium was once saturated below the northern portion of OU-1. However, recent groundwater elevations measured during annual groundwater monitoring events show that, except for a few small areas, the alluvium has become dewatered, and first groundwater now occurs within the UMCf (Ramboll 2021b).

Perchlorate and other contaminants found in groundwater in this area migrated from the NERT Site Study Area through subsurface transport in shallow groundwater to the Las Vegas Wash (Ramboll 2023b). The current perchlorate plume in shallow groundwater is illustrated in Figure 2-1.

2.1.3 Wildlife in the Vicinity of OU-1

Desert shrub habitats, like that in the vicinity of OU-1, support a variety of wildlife species. Presence of standing water in winter and growth of herbaceous plants in spring provide foraging areas and food for species in these seasons. Primary resident species are reptiles or rodents; however, other taxa are represented. Typical species include desert tortoise, a variety of lizards and snakes (including the desert iguana and common kingsnake), black-throated sparrow, various pocket mice and kangaroo rats, kit fox, coyote, bobcat, and a wide variety of birds, including quail, roadrunners, crows, doves, hummingbirds, and predatory birds. Burrowing animals include chipmunks, gophers, rabbits, squirrels, kangaroo rat, mice, burrowing owls, and various reptiles including the desert tortoise. Some desert burrowing animals tend to prefer silty, sandy, or gravelly soil for their burrows versus heavily compacted soils like that present in OU-1 (Patton 2005). A list of threatened and endangered species for Clark County, Nevada is provided in Table 2-1, along with the preferred habitats of listed species.

As indicated on Table 2-1, preferred habitat for the listed species, including the burrowing desert tortoise, is not present within OU-1. According to the Nevada Fish and Wildlife Office, there are no listed mammals in Clark County. The birds listed are riparian species that might be found near the Las Vegas Wash but would not be found in the vicinity of the OU-1 Refined SLERA Area. There have been sightings of the desert tortoise near the Las Vegas Wash but not in the vicinity of OU-1. A burrowing owl was observed by Ramboll staff on the east side of the Operations Area at the eastern end of the Beta Ditch outside of the fence in January 2015.

2.1.4 Ecological Exposure Media within OU-1

In a risk assessment, ecologically relevant media typically includes surface water, sediment (i.e., the upper six inches), and surface soil (i.e., the upper foot of the soil column) where

the vast majority of biological activity occurs (USEPA 2015). Subsurface soil and groundwater (at depth) are not relevant media for the purposes of an ERA due to the paucity of ecological receptors that have contact with these media, with the exception of burrowing animals and rooted plants which may have contact to subsurface soils greater than 1-foot bgs. While burrowing animals are very common in the southern Nevada desert ecosystems, the soils within OU-1 are heavily compacted, and foraging opportunities are very limited or non-existent. Therefore, the presence of burrowing animals within the OU-1 Refined SLERA Area is unlikely. Rooted plants are also scarce at OU-1 due to the heavily compacted soils and the historical removal of vegetation for operations. Nonetheless, the exposure of these receptors to subsurface soils was considered.

Groundwater becomes relevant in an ERA at the groundwater and surface water transition zone (i.e., the interface; USEPA 2008). As indicated in the Work Plan surface water and solids in holding ponds are not included as part of the refined SLERA because the surface water bodies on Site are operated under the purview of permits issued through NDEP. Therefore, surface soils are the only exposure media that are evaluated in the refined SLERA. Surface soil in and around the Leasehold debris pile located on the north-eastern side of OU-1 is also included in the refined SLERA (the Leasehold debris pile is shown on Figure 1-2c). The Leasehold debris pile, that has been present since approximately 1999, and for which EMD is responsible, is made of construction waste and cement debris and may attract small mammals for sheltering opportunities.

The screening focuses on using the maximum concentration of each chemical in surficial soil with a starting depth in the Operations Area in the 0 to 1-foot interval and end depths extending to 2.5 bgs. In Parcel E, only near surface samples were available for use in the refined SLERA from a depth interval of 1 to 1.5 ft. Using concentrations from locations with end depths greater than the 1-foot interval allows for a characterization of risk to burrowing animals such as the burrowing owl. For chemicals that exceed the screening criteria, attention was given to the spatial distribution of the chemical at the Site.

2.1.5 Preliminary Chemicals of Potential Ecological Concern

Preliminary constituents of potential ecological concern (PCOPECs) are defined as any chemical that was used or manufactured on the Site. PCOPECs are separate from COPECs, which are the chemicals that are carried into the screening process and through the refined SLERA. The chemical classes that were analyzed in soil from previous investigations in OU-1 that are evaluated in the OU-1 Refined SLERA are shown in Table 2-2.

While the screening steps are generally consistent with Steps 1 and 2 of USEPA's eight-step process, NDEP's SLERA Guidelines for the BMI Complex (NDEP 2006) allows for several additional tools to reduce the dataset and focus on those substances that contribute the greatest to the overall risk (USEPA 1989). Following NDEP (2006) guidance, in addition to evaluating the maximum concentration against screening criterion and comparison to background concentrations, the following additional procedures were used in the screening step to eliminate constituents from further quantitative evaluation where appropriate:

- Constituents that are not detected. Elimination of chemicals that are not detected includes an evaluation of sample quantitation limits (SQLs) relative to ESVs. PCOPECs that were not detected but have sample SQLs that exceed ESVs are retained in the Tier 1 screening evaluation in Table 3-1a and Table 3-1b and are discussed in the uncertainty assessment (Section 4.7).

- Constituents with detection frequencies of 5% or less. Regardless of detection frequency, any chemical with an HQ greater than 1 using the concentration is retained for further evaluation (Table 3-1a and Table 3-1b). A spatial evaluation of these chemicals is then conducted to determine if the detected concentrations are indicative of localized release or potential areas of elevated chemical concentrations. This evaluation is provided in the uncertainty assessment (Section 4.7).
- Constituents for which OU-1 Refined SLERA Area soil concentrations are below background concentrations (applicable to metals and radionuclides).

This process is further explained in the following subsections. PCOPECs not carried forward in the evaluation and the justification for the elimination of a PCOPEC are provided in the screening tables as described in Section 3.

2.1.5.1 Data Used in the OU-1 Refined SLERA

The data for the OU-1 Refined SLERA was processed following the approach used for the OU-1 Soil Baseline Health Risk Assessment (BHRA) (Ramboll 2020), which was discussed and approved by NDEP. The data processing steps implemented for the OU-1 Refined SLERA are discussed in Appendix C as follows:

- C-1 – Summary of Soil Samples Removed from SLERA Dataset Due to Remediation or Inaccessibility to Wildlife
- C-2 – List of Chemicals for Which Names and/or CASRN Were Standardized for SLERA Process
- C-3 – Summary of Soil Data Excluded During Data Processing
- C-4 – Summary of Rejected Soil Data
- C-5 – Revisions of Censored Data for Blank Contamination
- C-6 – Data Usability Evaluation Summary

The final data set used for the OU-1 Refined SLERA is presented in Appendix D-1. The dataset used in the refined SLERA also includes Ramboll calculated parameters as described below and presented in Appendix D-2:

- Dioxin/furan mixtures were considered using the toxicity equivalent quotient (TEQ) approach for birds and mammals, using World Health Organization (WHO) equivalency factors and consistent with USEPA guidance (Van den Berg et al. 2006). The Total TEQ was calculated by multiplying the actual gram weight of each dioxin and dioxin-like compounds by its corresponding mammalian toxic equivalency factor (TEF) and then summing the results to reflect potential exposures for mammals in terms of TEQ. Similarly, the Total TEQ was calculated by multiplying the actual gram weight of each dioxin and dioxin-like compounds by its corresponding avian TEF and then summing the results to reflect potential exposures for birds in terms of TEQ. The avian and mammalian TEQs used in this OU-1 Refined SLERA are provided in Appendix D, Table D-3.
- Polychlorinated biphenyls (PCBs) were also considered as TEQs using the WHO TEFs as described for dioxins and furans and as total PCBs (Appendix D, Table D-3). Total TEQs summing dioxin/furan TEQs and PCB TEQs were also considered (Appendix D, Table D-3). Additionally, concentrations of Aroclors 1242, 1248, 1254, and 1260

were estimated using PCB congener data from 37 surface soil and eight Parcel E soil samples. Briefly, PCB homolog concentrations were calculated from congener data, followed by estimation of Aroclor concentrations using percent homolog compositions of various Aroclors, as presented in Fuchsman et al. (2006). Calculations of PCB homolog and Aroclor concentrations are presented in Appendix D, Tables D-4, and D-5, respectively. Aroclors estimated using the above methodology were screened separately from measured Aroclor data.

- Polycyclic aromatic hydrocarbon (PAH) mixtures were considered as high molecular weight PAHs, low molecular weight PAHs, and total PAHs. The sum of PAHs is provided in Appendix D, Table D-6. Individual PAHs were summed into the following groups: total PAHs; low molecular weight PAHs (i.e., 1-methylnaphthalene, 2-methylnaphthalene, acenaphthene, acenaphthylene, anthracene, fluorene, naphthalene, and phenanthrene); and high-molecular weight PAHs (i.e., benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, fluoranthene, indeno(1,2,3-cd)pyrene, and pyrene).
- Organochlorine pesticide isomers including 4,4'-dichlorodiphenyltrichloroethane (DDT) and the isomers of DDT, 2,2' and 2,4'-dichlorodiphenyldichloroethane (DDD), and 2,2' and 2,4'-dichlorodiphenyldichloroethylene (DDE) are summed to obtain a total sum of combined DDT and isomer exposures (DDx) value for the evaluation of potential risks related to the chemical mixture. Not all locations were analyzed for all isomers. As such, the DDx sums are comprised of three to five isomers depending on the location. The sum of DDx values and how they are calculated by location is provided in Appendix D, Table D-7. The 4,4'-DDD, 4,4'-DDE, and 4-4'-DDT isomers were analyzed for all samples collected for DDT and metabolite analysis. 2,4'-DDE and 2,4'-DDD were only analyzed at a subset of samples. 2,4'-DDT was not analyzed at any locations within OU-1. The variability in the DDx isomers analyzed is further discussed in the Uncertainty Assessment (Section 4.7).

Individual chemicals comprising these calculations were not screened individually, but rather as part of their respective chemical mixture. For this refined SLERA, approximately 300 chemicals from 288 locations within the Operations Area and approximately 224 chemicals from 7 locations within Parcel E were evaluated, as shown in Figures 2-3a and 2-3b.

Areas of the Site considered to be inaccessible or highly unlikely to attract wildlife were not considered in the refined SLERA, as there would be no complete exposure pathway from source to receptor at these locations. Many of the ECAs defined within the Operation Area represent such areas. Most of the ECAs are in the interior of the Site and contain no significant attractive features for wildlife (many have operational structures or paved areas) and therefore wildlife would not generally forage or nest there. ECAs in the southern portion of Eco DU-1 and ECAs in Eco DU-2 and Eco DU-3 fall into this category (see Figure 1-3 and Appendix B-3).[11] Those ECAs that are at or near the boundary of the Site adjacent to areas outside of OU-1 that contain vegetation in open spaces where wildlife may be present were considered in the refined SLERA. Therefore, surface soil data from ECAs within the northern portion of Eco DU-1 were retained for the OU-1 Refined SLERA (Figure

[11] The photos in Appendix B-3 focus on areas covered in dirt to illustrate the lack of habitat in these ECAs. There are many ECAs that are also covered in pavement or have structures that are not in the photolog as these are areas that are obviously devoid of wildlife.

2-3a and 2-3b). All surface soil data available for Parcel E was included in the OU-1 Refined SLERA (Figure 2-3a and 2-3b). The areas included or excluded from the OU-1 Refined SLERA are discussed in detail in this section. Because the northern portion of Eco DU-1 is adjacent to Parcels C, D, and E that contain scrub vegetation, ECAs in this area were considered in the OU-1 Refined SLERA, as appropriate.

The evaluation of the OU-1 Refined SLERA Area is conducted in five discrete spatial units as illustrated in Figure 1-3 and summarized below:

- Operations Area: Includes the entire OU-1 Operations Area as a single unit
- Eco DU-1: Includes the northern portion of the Operations Area
- Eco DU-2: Includes the southern portion of the Operations Area
- Eco DU-3: Includes the central portion of the Operations Area
- Parcel E: Is an 8.6-acre parcel in the northwest portion of OU-1

The Tier 2 evaluation (consistent with Step 3a of USEPA's eight-step ERA process) described in Section 3 uses the results from Tier 1 to evaluate each of the spatial units where the Operations Area is evaluated as a single unit, and the three Eco DUs are evaluated separately. The sub-areas were evaluated individually so that no chemicals are eliminated from the risk assessment process prematurely.

This refined SLERA evaluates potential risks associated with the following constituent groups (Table 2-2):

• Chlorine oxyanions • Dioxins/furans • Metals • Pesticides, organochlorine, and organophosphates (including DDT + metabolites [DDx]) • PCBs	• General Chemistry (i.e., nitrates, sulfates, ammonia, etc.) • PAHs • Organics • Radionuclide compounds • Semi-Volatile organic compounds (SVOCs) • Volatile organic compounds (VOCs) • Total petroleum hydrocarbons (TPH)

The chemical count in the initial screening includes the Ramboll calculated sums for PAHs (total PAHs, low molecular weight PAHs, and high molecular weight PAHs); PCBs (total and Aroclor calculated); DDx (DDT and metabolites); TEQs (dioxins/furans, PCBs, and sum of dioxin/furans and PCBs); and a sum total of dioxins/furans plus PCBs, using both substitution methods for non-detected concentrations (ND=0 and ND=0.5DL) and evaluating TEQs as both mammal and avian TEQs. This excludes the individual chemicals comprising the sums as well as chemicals considered not hazardous to ecological receptors (e.g., pH, chloride, total organic carbon).

In order to focus on those substances that potentially contribute the greatest to the overall risk, several procedures were used to eliminate constituents for quantitative evaluation in

the screening, consistent with the SLERA Guidelines for the BMI Complex, Henderson, Nevada (NDEP 2006):

- Comparison to Background: Identification of constituents with detected levels which are equivalent to or less than background concentrations (where applicable). The procedure for evaluating constituents relative to background conditions is presented in Section 2.1.5.2.
- Detection Frequency: In general, constituents exhibiting a low frequency of detection will not contribute significantly to the risk estimates. USEPA (1989) suggests that constituents with a frequency of detection less than or equal to 5%, except for metals, known human carcinogens, and persistent, bioaccumulative, and toxic (PBT) constituents as defined by the USEPA PBT program (USEPA 2007a), may be considered for elimination. Chemicals with a frequency of detection less than 5% were retained for additional evaluation unless hazard quotients (HQs) using concentrations were less than or equal to 1. Spatial plots for these chemicals were also evaluated to ensure that they do not represent localized elevated concentrations. This evaluation is provided in the uncertainty assessment (Section 4.7).

2.1.5.2 Evaluation of Site Concentrations Relative to Background Conditions

Some chemicals (particularly naturally occurring metals) may be present in environmental media but are unrelated to Site releases. These constituents are called background constituents and can fall into two broad categories:

- Chemicals that are naturally occurring: Metals often occur naturally in soil and geological formations and may be transported into surrounding soils and water by processes like weathering and dissolution of the underlying soil.
- Chemicals present due to anthropogenic sources (USEPA 2001): Background chemicals may come from a variety of anthropogenic sources such as road runoff, atmospheric deposition, washout by rainfall (or precipitation scavenging), and surface flow of chemicals from upstream sources unrelated to activities at the Site.

USEPA (1989, 1992a, b) and NDEP (2009b) guidance allows for the elimination of constituents from further quantitative evaluation if detected levels are not elevated above naturally occurring levels. Typically, COPECs are selected for a risk assessment if they are elevated above naturally occurring levels based on statistical analyses. Generally, this approach is applicable to metals and radionuclides (USEPA 1989).

The Basic Remediation Company (BRC) and Titanium Metals Corporation of America (BRC/TIMET) regional background data set (BRC/TIMET 2007) is summarized in Appendix E-1 of this refined SLERA report. Specifically, as recommended by Neptune (2017), the 95 McCullough samples collected as part of the BRC/TIMET background study were used in the background evaluation for the NERT Site. The statistical evaluation of the background data is provided in Appendix E-2.

NDEP guidance (2008a) recommends including field duplicates in a data set when the variance of the duplicates is similar to the variance of the primary samples. As noted in the guidance, field duplicate samples represent a discrete and unique measurement of soil chemical conditions proximal to the primary sample (unlike split samples). For the

background evaluation presented in this report, soil samples with primary and field duplicate results were treated as independent samples, consistent with Option 2 in NDEP guidance (NDEP 2008b).

The background evaluation was performed using normal and lognormal Q-Q plots, and side-by-side box-and-whisker plots (boxplots). These plots are included in Appendix E-2. Normal and lognormal Q-Q plots provide a visual assessment of how closely the data follow a normal or lognormal distribution. Data points that fall roughly on a straight line may be considered to follow a normal or lognormal distribution. Both background and OU-1 Refined SLERA Area soil data are included on these plots such that the Q-Q plots provide a direct visual comparison of the two distributions. The Shapiro-Wilk test was used to evaluate the consistency of each data set more formally with a normal or lognormal distribution.

Box plots provide a visual comparison between OU-1 Refined SLERA Area and background data. For each data set, the "box" in the box-and-whisker plot encompasses the central 50% of the results (i.e., the results from the 25th to 75th percentiles, or equivalently, between the first quartile [Q1] and the third quartile [Q3]). Substantial overlap between the boxes for background and OU-1 Refined SLERA Area data indicates that the OU-2 SLERA data may not be significantly different from background. The whiskers demarcate one "step" above the 75th percentile and one step below the 25th percentile. One "step" is defined as 1.5 times the interquartile range (IQR), the difference between the 75th and 25th percentiles. Data points above and below the whiskers are considered potential outliers from the distribution and are shown on the plots as open circles for non-detected values and as crosses for detected values.

The computer statistical software program R (R Core Team 2019) was used to perform all statistical tests.[12] Statistical background comparisons were performed using the t-test, Gehan test, Quantile test, and Slippage test. This suite of tests is sometimes referred to as "Gilbert's Toolbox." The t-test is a parametric test (i.e., an underlying condition is that the data or log-transformed data are normally distributed). In contrast, the Gehan test, Quantile test, and Slippage test are nonparametric, and thus do not require that the data are normally or lognormally distributed (USEPA 2002; NDEP 2009b). These tests are described below:

- The two-sample t-test tests for equality of the means of OU-1 Refined SLERA Area soil and background concentrations. An underlying assumption of the test is that concentrations are normally distributed for both data sets.
- The Gehan test is a modification of the Wilcoxon Rank Sum test that evaluates the difference between the sums of the ranks for two populations. This is a nonparametric method for assessing differences in the center of the distributions and is based solely on the relative order (or ranking) of the observations from the two samples. This test has less power than the two-sample t-test when the data are normally distributed, but the assumptions are not as restrictive. The Gehan test uses the Mantel approach for ranking the data, which is equivalent to using the Gehan ranking system. The Gehan ranking system is used to rank non-detects with the detected concentrations (NDEP 2009b).

[12] Neptune provided Ramboll with a copy of the R codes used for the statistical background evaluation on May 18, 2020.

- The Quantile test evaluates "tail effects" that are not specifically considered in the Wilcoxon Rank Sum test. The Quantile test looks for differences in the right tails (upper end of the distribution), rather than evaluating central tendency. The Quantile test was performed using a defined quantile of 0.80, consistent with the approach used in the Parcels Soil HRA (Northgate Environmental Management, Inc. [Northgate] 2014).
- The Slippage test looks for a shift to the right in the extreme right tail of the background data set as compared with the extreme right tail of the OU-1 Refined SLERA Area data set. This test evaluates whether the number of OU-1 Refined SLERA Area samples with concentrations greater than the maximum background concentration is greater than would be expected statistically if the soils within the OU-1 Refined SLERA Area and background distributions were the same.

Consistent with NDEP guidance (NDEP 2009b), non-detect results are set equal to the detection limit for the non-parametric tests, because substitution is not required for the non-parametric tests, which use the Gehan ranking scheme to rank non-detects. For the parametric tests (i.e., t-test), the Gehan ranking scheme cannot be used, and non-detect results are set equal to one half the detection limit.

The background dataset used for the OU-1 Refined SLERA is presented in Appendix E-1. Appendix E-2 details the background evaluation for metals and radionuclides as follows:

- Table E-2a presents summary statistics for each metal, including the total number of samples, number of detections, percent detections, minimum SQL, maximum SQL, minimum detected value, maximum detected value, median, mean, and standard deviation. Consistent with NDEP guidance (NDEP 2008a), the median, mean, and standard deviation are calculated based on detected concentrations only. The results of the Shapiro-Wilk test are also presented.
- Table E-2b includes the calculated probability (p-values) for the four statistical tests and the overall determination as to whether soil concentrations within the OU-1 Refined SLERA Area are greater than background levels (five results are shown in the table because the t-test was performed twice—once on the raw data set and once on the log-transformed data set).
- Table E-2c presents summary statistics for each radionuclide. This is the same information as provided in Table E-2a for metals but for radionuclides.
- Table E-2d provides the same information as presented for metals in Table E-2b but for radionuclides.
- Table E-2h presents summary statistics for each non-metal inorganic constituent. This is the same information as provided in Table E-2a for metals but for inorganics.
- Table E-2i provides the same information as presented for metals in Table E-2b but for non-metal inorganics.
- Figures E-2a and E-2b presents boxplots for metals and radionuclides in background soils and OU-1 Refined SLERA Area soils (upper 2.5 ft).
- Figures E-2c through E-2l presents normal and lognormal Q-Q plots for metals and radionuclides in background soils and OU-1 Refined SLERA Area soils (upper 2.5 ft).

- Figures E-2m through E-2r presents boxplots and normal and lognormal Q-Q plots for non-metal inorganics in background soils and OU-1 Refined SLERA Area soils (upper 2.5 ft).

A significance level of alpha = 0.025 was used to evaluate the statistical significance of the Gilbert's Toolbox results, consistent with NDEP guidance (NDEP 2009b).

2.1.5.3 Radionuclide-Specific Evaluation

The background (BRC/TIMET) data set includes results for the long-lived radionuclides in the U-238 decay series (U-238, U-234, Th-230, and Ra-226) and in the Th-232 series (Th-232, Ra-228, and Th-228). The BRC/TIMET background data set also includes data for U-235, but not for the U-235 decay chain. NDEP guidance (2009c) notes that most isotopes of the U-235 decay chain are barely discernible from the minimal detectable concentrations. The background evaluation and tests for secular equilibrium are presented in Appendix E-2, as follows:

- Tables E-2e and E-2f present the results of the equivalence testing for secular equilibrium of the uranium decay series (U-238 chain) and thorium decay series (Th-232 chain), respectively.
- Table E-2g presents the correlation matrices for the uranium decay series and the thorium decay series.

The significance level used for the background evaluation of metals (alpha = 0.025) was also used for the background evaluation of radionuclides.

2.1.6 Description of Potentially Exposed Receptors

The identification of the categories of receptors most likely affected by Site activities helps focus the refined SLERA. The site reconnaissance survey provided information on potential wildlife and habitats present in OU-1. The Clark County, Nevada Species Account Manual (2003) summarizes the appearance, occurrence, life histories and habitat preferences of a wide variety of species within Clark County, Nevada. Information from these documents and the site reconnaissance survey were used to identify potentially exposed receptors.

The rationale for selecting each group of terrestrial receptors is discussed below:

- Soil Invertebrates. The terrestrial invertebrate community lives in constant and direct contact with surface soil that may be impacted. Invertebrates have vital functions within the ecosystem, including serving as a prey base for higher trophic level organisms and cycling of nutrients.
- Plants. Plant roots are in constant and direct contact with soil that may be impacted by chemical constituents. Plant communities provide food for herbivores and essential habitat for many animal species.
- Terrestrial-feeding Wildlife. Birds, mammals, and reptiles are exposed to constituents in surface soil primarily through prey ingestion. As higher trophic level species, birds, mammals, and reptiles are susceptible to compounds that bioaccumulate through the food chain. Individual foraging strategies and choices of prey may also promote incidental soil ingestion.

Microorganisms in soil are not considered in the refined SLERA consistent with NDEP guidance (NDEP 2006). The United States Fish and Wildlife Service (USFWS) and NDEP are

the federal and state agencies, respectively, responsible for monitoring and managing at risk and protected species. Species with threatened or endangered listing status in Clark County are provided in Table 2-1. Of the species listed on Table 2-1, aquatic species, such as amphibians, fish, and aquatic-feeding birds, would not be present within the OU-1 Refined SLERA Area due to the absence of water resources. There is no record of special status species observations at or in the immediate vicinity of OU-1, and no special status species are expected within OU-1. Based on the site reconnaissance efforts, there is no critical habitat on or in the immediate vicinity surrounding OU-1.[13]

2.1.7 Identification of Potentially Complete Exposure Pathways

A complete exposure pathway is one in which chemicals can be traced or expected to travel from the source to a receptor (USEPA 1997). A complete exposure pathway has five parts:

- A source of chemical constituents.
- An environmental medium and transport mechanism (such as spills, leaks, and/or runoff).
- A point of exposure (impacted soils).
- A route of exposure (such as a receptor touching or eating contaminated soil).
- A population of receptors (such as a community of terrestrial invertebrates).

The exposure pathway is complete and potentially capable of causing unacceptable risks only when all five parts are present. A CSM is intended to provide a clear description of how ecological receptors may come into contact with Site-related constituents via release mechanisms and exposure to soil and/or associated food items. The ecological CSM for the Operations Area and Parcel E is provided in Figure 2-4. The CSM includes contaminant sources, release mechanisms, exposure media, exposure routes, and ecological receptors that were evaluated in this OU-1 Refined SLERA, based on the current understanding of environmental conditions in the Operations Area and Parcel E. This information was used as necessary to understand potentially complete ecological exposure pathways from soil for each receptor group in the Operations Area and Parcel E. As described in the OU-1 Soil BHRA (Ramboll 2020), NDEP issued LOUs for 70 source areas (or areas for further investigation) which included areas that are currently used for chemical production, areas that are no longer active, and/or areas where surface soil contamination has previously been addressed.[14] Historical releases from potential source areas have been documented or inferred from field investigations that have identified chemically impacted soils and other media.

Figure 2-5 reflects the potentially complete exposure pathways and wildlife receptors included in the desert food web model for the OU-1 Refined SLERA Area. Figure 2-5 shows representative receptors of a southern Nevada desert food web and captures the major feeding guilds within the desert of southern Nevada. These same representative species

[13] Critical habitat is a term defined and used in the Endangered Species Act. It is a specific geographic area that contains features essential to the conservation of an endangered or threatened species and that may require special management and protection (USFWS 2014).

[14] NDEP identified 69 areas in 1994; an additional area, the US Vanadium Site was identified later and is referred to as #70.

shown in Figure 2-5 are included in the OU-1 Refined SLERA food web model as discussed in Section 4 of this report.

- Direct contact of terrestrial invertebrates to COPECs in surface soil.
- Direct contact and root uptake of surface soil COPECs by terrestrial plants.[15]
- Exposure of terrestrial birds, mammals, and reptiles to COPECs through the incidental ingestion of soil and ingestion of terrestrial food items. Although other exposures, such as dermal (i.e., direct contact) or inhalation may occur, these routes are poorly characterized for most wildlife species. Ingestion is considered the primary route of exposure for wildlife.

2.1.8 Identification of Generic Assessment and Measurement Endpoints

Ecological risk endpoints define ecological attributes that are to be protected (assessment endpoints) and measurable characteristics of those attributes (measurement endpoints). Assessment endpoints most often relate to attributes of biological populations or communities and focus the risk assessment on particular components of the ecosystem that are potentially at risk (USEPA 1997, 2003). Assessment endpoints describe an entity (e.g., carnivorous mammals) and an attribute of that entity (e.g., survival rate). A measurement endpoint is a measurable ecological characteristic and/or response to a stressor and provides a method of quantifying potential effects on the receptors potentially at risk (USEPA 1998).

Because of the complexity of natural systems, it is generally not possible to directly assess the potential impacts to all ecological receptors present within an area. Therefore, receptor species (e.g., coyotes) or species groups (e.g., rabbits) are often selected as surrogates to evaluate potential risks to larger components of the ecological community, or guilds (e.g., carnivorous mammals), represented in the assessment endpoints (e.g., survival and reproduction of carnivorous mammals).

Appropriate assessment endpoints for this OU-1 Refined SLERA include those receptors that may be affected by COPECs at the Site, and for which complete exposure pathways exist. Ecological receptors are selected for their potential exposure, ecological significance, economic importance, societal relevance, and/or cultural significance.

The assessment endpoints used for the OU-1 Refined SLERA are as follows:

- Survival, growth, and function of terrestrial plant communities within the OU-1 Refined SLERA Area.
- Survival, growth, and function of terrestrial invertebrate communities within the OU-1 Refined SLERA Area.
- Survival, growth, and reproductive ability of bird populations within the OU-1 Refined SLERA Area.
- Survival, growth, and reproductive ability of mammal populations within the OU-1 Refined SLERA Area.

[15] The term plants in this OU-1 Refined SLERA includes all vascular, photosynthetic terrestrial plants consistent with NDEP (2006).

- Survival, growth, and reproductive ability of reptile populations within the OU-1 Refined SLERA Area.[16]

As described by Barnthouse et al. (2008), "regulations, policies, directives, and guidance documents frequently discuss the need for ERAs to consider risks to populations, not simply to individual organisms or organism-level attributes. The reason for this [need] is that, from a management perspective, the population-level attributes such as abundance, persistence, age and composition can be more relevant than are the health or persistence of individual organisms."

The assessment endpoints listed above consider attributes that are tied to population-level abundance and persistence (birds, mammals, and reptiles) or community level (plants and soil invertebrates), in that they consider survival, growth and reproduction. Decreased survival will result in smaller numbers of individuals, decreasing the population of that receptor. Growth measurements such as reduced body weights (BWs) can be associated with lower fitness and lower reproductive success, leading to a reduction in the receptor population. Similarly, decreased reproduction can result in smaller numbers of individuals over time, also decreasing the population of that receptor. The focus of this OU-1 Refined SLERA on populations and communities is consistent with USEPA's Generic Ecological Assessment Endpoints for ERA (2016b) and the USEPA Ecological Risk Assessment and Management Principles (1999b).

The analysis for special status species (including federally listed threatened and endangered species) is performed on an individual level, as even a single individual comprises a larger percentage of those populations at risk. There is no critical habitat in OU-1, and no record of special status species being observed at or in the immediate vicinity of OU-1 (Table 2-1).

Conservative ESVs available for a chemical are used during the screening process so that ecological receptors are protected. As such, the measure of potential effect (or measurement endpoint) is the comparison of soil concentrations against conservative ESVs among soil invertebrate, plant, bird, and mammal studies.

2.2 Screening-Level Ecological Effects Evaluation

The screening-level ecological effects evaluation involves the identification of protective constituent ESVs for comparison to detected soil constituents at the Site. Conservative soil ESVs that are highly protective were used in the effects evaluation and are provided in Table 2-3. ESVs are chemical concentrations in environmental media below which there is negligible risk to receptors exposed to those media (USEPA Region 4 2018). In the screening step, the maximum concentrations detected in surface soil in each of the five spatial units within the OU-1 Refined SLERA Area (summarized in Tables 2-4a through 2-4e) are compared to the conservative ESVs provided in Table 2-3.

The ecological receptors that reside in OU-1 are assumed to be as sensitive to the constituents as the most sensitive organisms used to develop the ESVs. ESVs are available from other scientific literature sources, one or more of which may be relevant to any given site. Further, ESVs may not be available from each source; therefore, consideration of a range of sources provides greater opportunity for identification of ESVs. The ESV hierarchy

[16] Due to the lack of toxicity data available for reptiles, the evaluation for reptiles is presented qualitatively in the OU-1 Refined SLERA Report.

used in the OU-1 Refined SLERA, consistent with the OU-1 Refined SLERA Work Plan (Ramboll Environ 2015), is from the following sources in order of priority as listed:

- USEPA Ecological Soil Screening Levels (Eco-SSLs) (2007b, c, d, and e): The Eco-SSLs are based on a variety of studies that consider effects at multiple levels of the food web.
- USEPA Region 4 (2018): Regional Ecological Risk Assessment Supplemental Guidance.
- USEPA Region 6 (1999a): Screening-Level Ecological Risk Assessment Protocol for Hazardous Waste Combustion Facilities (EPA530-D-99-001A)-Appendix E, Toxicity Reference Values (TRVs).
- Oak Ridge National Laboratory (ORNL) terrestrial plant and invertebrate (earthworm) screening values (Efroymson, et al. 1997a, 1997b, 1997c). Values for soil microorganisms and microbial processes (Efroymson et al. 1997b) were used in cases when earthworm-based values are not available.
- Los Alamos National Laboratory (LANL) EcoRisk Database (Version 4.2) (LANL 2020).

The primary criteria sources listed above (i.e., LANL, Eco-SSLs, USEPA Region 4, ORNL, and USEPA Region 6) may not have ESVs for every chemical that was detected in surface soil in the OU-1 Refined SLERA soil dataset. As such, secondary sources of criteria, such as the following, were also considered:

- The USEPA's ECOTOX database (USEPA 2009).
- ORNL's Risk Assessment Information System database (ORNL 2009).
- Agency for Toxic Substances and Disease Registry's (ATSDR's) toxicological profiles database (ATSDR 2009).
- NOAA Screening Quick Reference Tables (SQuiRT) (NOAA 2008).

Secondary sources are typically less rigorous and/or less applicable than primary sources. For example, the secondary values could be derived using fewer toxicity studies representing fewer species than are used to derive the primary values (Suter and Tsao 1996). Nevertheless, they do represent available data that are relevant for a refined SLERA and for obscure or rarely detected chemicals. Secondary sources present a readily available option for application in the refined SLERA.

The radionuclide contaminants being screened in the refined SLERA were evaluated based on a comparison of concentrations of radionuclides in soil compared to TRVs used as ESVs provided by LANL (2020) and a comparison to background concentrations in soil. The pathways of exposure include external exposure from soil and internal exposure from the uptake of radionuclides in food and water, and ingestion of soil. ESVs for radionuclides are derived from models that calculate the internal and external dose (LANL 2020). Background concentrations for radionuclides are also considered as a basis to exclude these constituents in this OU-1 Refined SLERA.

3. STEP 2: SCREENING-LEVEL EXPOSURE ASSESSMENT AND RISK CALCULATION

The screening-level exposure assessment (Step 2) is comprised of the calculation of exposure and risk estimates, and the evaluation of uncertainties in the exposure and risk estimates (USEPA 1997, 2001). The screening-level risk calculations are conducted by 1) estimating to what level a plant or animal is exposed to a particular contaminant, and 2) comparing maximum contaminant concentrations to ESVs. The process concludes with a Scientific-Management Decision Point (SMDP), at which it is determined if:

- ecological threats are almost, or entirely, absent and therefore no further work is needed;
- the ERA should continue to determine whether risk exists; or
- there is the possibility of adverse ecological effects and a more detailed ERA, with more information about the site, is needed.

3.1 Identification of Screening-Level Exposure Estimates

The maximum concentrations detected in surface soil in each of the five spatial units within the OU-1 Refined SLERA Area are shown in Tables 2-4a through 2-4e and include summary statistics, such as the number of samples analyzed, the percent of detections, and the maximum detected concentrations for each constituent.

3.2 Screening-Level Risk Calculations

Risk estimates were calculated in the refined SLERA by dividing conservative chemical-specific exposure estimates by conservative chemical-specific ESVs. These unitless chemical-specific ratios are referred to HQs. HQs are defined by USEPA as follows:

- An HQ less than or equal to a value of 1 indicates that adverse impacts to wildlife are considered unlikely (USEPA 1997, NDEP 2006). HQs are rounded to one significant figure (USEPA 2004).
- At the screening level where conservatively protective assumptions are used, an HQ exceeding a value of 1 indicates that further evaluation may be necessary to understand if that constituent is likely to pose an unacceptable risk to plants and wildlife.

The screening of detected constituents against ESVs using maximum concentrations and associated HQs are provided for the Operations Area and Parcel E in Tables 3-1a and 3-1b, respectively, and involves the following conservatively protective assumptions:

- The maximum constituent concentrations in soils were used to quantify risk to ecological receptors. Therefore, the receptors of concern were assumed to be exposed to only the maximum concentrations within the OU-1 Refined SLERA Area rather than the actual range of concentrations.
- Conservatively protective ESVs were used. The ecological receptors that reside within the OU-1 Refined SLERA Area are assumed to be as sensitive to the constituents as the most sensitive organisms used to develop the ESVs.
- It was assumed that ecological receptors spend their entire life within the boundaries of the OU-1 Refined SLERA Area where the maximum concentration was detected,

even if that area contains no habitat for ecological receptors and even if ecological receptors wander in and out of the OU-1 Refined SLERA Area boundaries.

Selecting the maximum concentration as the screening-level exposure value is conservative and protective. With the exception of plants and some less-mobile terrestrial invertebrates, it is very unlikely that most organisms would be exposed to the maximum concentration of a chemical for 100% of their life or even 100% of their day. Because wildlife moves throughout their home range, they are more likely to experience a wide range of concentrations throughout their life cycle and even during a single day. However, in keeping with the conservative nature of a refined SLERA, maximum detected chemical concentrations were used in the screening. In addition, consistent with NDEP guidance for a SLERA (NDEP 2006), the frequency of detection of a chemical and its background concentration, if available, were also considered in the screening.

The screening for the Operations Area (includes Eco DU-1, Eco DU-2, and Eco DU-3) and for Parcel E was conducted in two steps as follows:

Tier 1 Screening: The Tier 1 screening included an evaluation of all chemical constituents analyzed within the Operations Area and Parcel E. The results of the Tier 1 screening are provided in Table 3-1a. The results of the screening evaluation in Parcel E are provided in Table 3-1b.

Chemicals were eliminated from further screening in the Tier 1 evaluation if:

- The maximum constituent concentrations in soil were less than protective ESVs resulting in HQs less than or equal to 1.

  The chemical was not detected and the SQL at every sampling location was less than the chemical specific ESV.

- The soil constituent concentrations were similar to or lower than the BRC/TIMET Regional Background Dataset (2007) for each area evaluated.

The concentrations within the three Eco DUs and Parcel E are compared separately to the Regional Background dataset in order to determine whether chemical constituents can be eliminated based on a background evaluation that is specific to each Eco DU.

The screening results for each Eco DU are provided in the Table 3-2a through 3-2c as follows: Table 3-2a Eco DU-1, Table 3-2b for Eco DU-2, and Table 3-2c for Eco DU-3.

Chemicals were eliminated from further screening in the Tier 2 evaluation if:

- The maximum soil constituent concentrations were less than protective ESVs resulting in HQs less than or equal to 1.
- The soil constituent concentrations were similar to or lower than the BRC/TIMET Regional Background Dataset (2007) for each area evaluated.

Tables E-2b, E-2d, and E-2i in Appendix E include some *p*-values that are equal to 1. In a 1-sided test this implies a strong significant difference between background and site data. There are a few locations within the OU-1 Refined SLERA Area where concentrations for some metals are less than the McCollough background on which background comparisons are performed. Because these samples had concentrations below the regional background concentrations, they were eliminated from further evaluation. Possible explanations for the differences include minor geologic differences in the areas being sampled, surface

topography, natural spatial variability, sample intervals, analytical techniques, and minor surficial differences due to surface water and wind.

Even within a single geologic unit, it can be difficult to obtain a perfect representation of local background for every existing site data set or relevant subset of data across this study area due to the inherent variability of alluvial systems. Therefore, not every variance between site and background data must be due to anthropological influence or analytical issues. These explanations are discussed in greater detail in Section 4.7.4.

A screening using more realistic exposure assumptions, specifically exposure to the 95% UCL concentration rather than the maximum concentration, is conducted in Tier 2 during the refinement (Step 3a Refined Screening, Section 4), (e.g., 95% UCL).

3.3 Screening-Level Risk Results

This section summarizes the Tier 1 screening results. The results summarized here are also provided in Tables 3-1a through 3-2c. The results of the Tier 1 Screening evaluation are presented for each of the five spatial units including the Operations Area, the three Eco DUs, and Parcel E. Constituents are screened resulting in one of three determinations:

- Retained for screening,
- Excluded from screening, or
- Retained for the Uncertainty Assessment (Section 4.7).

Detected chemicals (or chemical mixtures) with HQs greater than 1 using soil concentrations (except for chemicals consistent with background concentrations) were retained for further screening (Section 4). Detected chemicals (or chemical mixtures) with no ESVs, non-detected chemicals where SQLs exceed ESVs, and non-detected chemicals with no ESVs are summarized in the Uncertainty Assessment (Section 4.7).

A summary of the screening results for each of the five OU-1 Refined SLERA subareas is provided in Exhibit 3-1 and discussed below.

Exhibit 3-1. Chemicals Evaluated in Tier I and Retained for Tier 2						
	Op Area	**Eco DU-1**	**Eco DU-2**	**Eco DU-3**	**Parcel E**	
# Chemicals Analyzed	300	98	91	91	224	
# Chemicals Detected	129	63	45	41	49	
# Chemicals Not Detected	171	35	46	50	175	
# Chemicals Retained for Tier 2 Screening	**98**	**95**	**51**	**43**	**32**	
Detected, No ESV	22	20	9	8	5	
Maximum HQ >1	43	42	16	10	5	
Not Detected, SQL > ESV	33	33	26	25	22	
Lowest HQ above 1	2	2	2	2	2	
Maximum HQ	40,000	40,000	500	10,000	80	
# Chemicals Excluded from Further Screening	**106**	**1**	**31**	**37**	**119**	
Detected, consistent with background	24	0	11	15	29	
Detected, HQ ≤ 1	40	1	9	8	15	
Not Detected, SQL ≤ ESV	42	0	11	14	75	
# Chemicals That Are Uncertainties (Not Detected, No ESV)	96		2	9	11	73

Notes:
ecological decision unit (Eco DU); ecological screening value (ESV); hazard quotient (HQ); sample quantitation limit (SQL); upper confidence limit of the mean (UCL)

3.3.1 Tier 1 Operations Area Screening Results

The Tier 1 evaluation allows for the elimination of chemicals that are not detected with SQLs below their respective ESVs, have HQs using soil concentrations that are less than or equal to 1, or that are consistent with background concentrations.

The Tier 1 Operations Area evaluation included 300 chemicals. 129 chemicals were detected, and 171 chemicals were not detected (as shown on Table 3-1a).

- 98 chemicals were retained for further evaluation (Section 4):
  - 22 chemicals were detected and have no ESVs.
  - 43 chemicals had soil concentration HQs greater than 1. The lowest HQ retained was 2 and the HQ was 40,000.
  - 33 chemicals were not detected, but their SQLs were greater than their ESVs.
- 106 chemicals were excluded from further screening:
  - 24 chemicals were detected and were consistent with background concentrations.

  - 40 chemicals had soil concentration HQs less than or equal to 1.
  - 42 chemicals were not detected, and the SQLs were less than their ESVs.
- 96 chemicals were not detected and have no ESVs and were retained in the Uncertainty Assessment (Section 4.7).

3.3.2 Eco DU-1 Screening Results

The Eco DU-1 (the northern subset of the Operations Area) evaluation included 98 chemicals. 63 chemicals were detected, and 35 chemicals were not detected (as shown on Table 3-2a).

- 95 chemicals were retained for further evaluation (Section 4):
  - 20 chemicals were detected and have no ESVs.
  - 42 chemicals had soil concentration HQs greater than 1. The lowest HQ retained was 2 and the HQ was 40,000.
  - 33 chemicals were not detected, but their SQLs were greater than their ESVs.
- 1 chemical (oil range organics) was excluded from further screening because its HQ is equal to 1.
- 2 chemicals were not detected and have no ESVs and were retained for the uncertainty assessment (Section 4.7)

3.3.3 Eco DU-2 Screening Results

The Eco DU-2 (the southern subset of the Operations Area) evaluation included 91 chemicals. 45 chemicals were detected, and 46 chemicals were not detected (as shown on Table 3-2b).

- 51 chemicals were retained for further screening (Section 4):
  - 9 chemicals were detected and have no ESVs.
  - 16 chemicals had soil concentration HQs greater than 1. The lowest HQ retained was 2 and the HQ was 500.
  - 26 chemicals were not detected, but their SQLs were greater than their ESVs.
- 31 chemicals were excluded from further screening:
  - 11 chemicals were detected and were consistent with background concentrations.
  - 9 chemicals had soil concentration HQs less than 1.
  - 11 chemicals were not detected, and the SQLs were less than their ESVs.
- 9 chemicals were not detected and have no ESVs and were retained for the Uncertainty Assessment (Section 4.7).

3.3.4 Eco DU-3 Screening Results

The Eco DU-3 (the central subset of the Operations Area) evaluation included 91 chemicals. 41 chemicals were detected, and 50 chemicals were not detected (as shown on Table 3-2c).

- 43 chemicals were retained for further screening (Section 4):
  - 8 chemicals were detected and have no ESVs.

  - 10 chemicals had soil concentration HQs greater than 1. The lowest HQ retained was 2 and the HQ was 10,000.
  - 25 chemicals were not detected, but their SQLs were greater than their ESVs.
- 37 chemicals were excluded from further screening:
  - 15 chemicals were detected and were consistent with background concentrations.
  - 8 chemicals had soil concentration HQs less than 1.
  - 14 chemicals were not detected, and the SQLs were less than their ESVs.
- 11 chemicals were not detected and have no ESVs and were retained for the Uncertainty Assessment (Section 4.7).

3.3.5 Parcel E Screening Results

The Parcel E (area to the northwest of the operations area) evaluation included 224 chemicals. 49 chemicals were detected, and 175 chemicals were not detected (as shown on Table 3-1b).

- 32 chemicals were retained for further screening (Section 4):
  - 5 chemicals were detected and have no ESVs.
  - 5 chemicals had soil concentration HQs greater than 1. The lowest HQ retained was 2 and the HQ was 80.
  - 22 chemicals were not detected, but their SQLs were greater than their ESVs.
- 119 chemicals were excluded from further screening:
  - 29 chemicals were detected and were consistent with background concentrations.
  - 15 chemicals had soil concentration HQs less than 1.
  - 75 chemicals were not detected, and the SQLs were less than their ESVs.
- 73 chemicals were not detected and have no ESVs and were retained for the Uncertainty Assessment (Section 4.7).

3.3.6 Spatial Plots for Constituents with Maximum Soil Concentrations that Exceed Conservative ESVs

There are 43 chemicals in the Operations Area and 5 chemicals in Parcel E with HQs greater than 1 using concentrations and conservative ESVs. Spatial plots are provided for these 43 chemicals[17] and a brief discussion of these chemical groups is provided below as they pertain to the ESVs.

- Figure 3-1: Perchlorate
- Figure 3-2 Series: Dioxins/Furans
- Figure 3-3 Series: Metals

[17] The 5 chemicals in Parcel E with HQs greater than 1 overlap with the 43 chemicals in the operations area. For completeness, Parcel E surface soil data is shown for the additional 38 chemicals not retained in this area, if available.

- Figure 3-4 Series: SVOCs
- Figure 3-5 Series: VOCs
- Figure 3-6 Series: Organochlorine Pesticides
- Figure 3-7 Series: Polychlorinated Biphenyls
- Figure 3-8 Series: Petroleum Hydrocarbons

3.3.6.1 Perchlorate

The RI Report for OU-1 and OU-2 states that elevated concentrations of perchlorate are widely distributed throughout OU-1. Spatial plots of perchlorate in surface soils are provided in Figures 3-1a and 3-1b relative to the lowest ESV for perchlorate. The perchlorate HQ using surface soil concentrations (screening HQ) was 40,000 and that HQ was based on the highest concentration detected at location SA72 (Table 3-1a provides the screening HQs, Figure 3-1b shows the concentration detected, Figure 1-2c shows Site features, and Figure 2-3b provides sample locations). The detected concentration of perchlorate in surface soils was located within an ECA near Former Ammonium Perchlorate Plant Pond 5 (AP-5) in Eco DU-1. As can be seen on Figure 3-1a and 3-1b, many of detected concentrations exceed ESVs by a factor of 100 or more. As indicated on Figure 3-1b, perchlorate concentrations consistently exceed the LANL minimum no observed adverse effect level (NOAEL) TRV of 0.12 mg/kg. Figure 3-1c shows the spatial distribution of perchlorate HQs across the OU-1 Refined SLERA Area. As illustrated, higher perchlorate concentrations in soil appear to be well distributed through Eco DU-1 with concentrations lower in Eco DU-2.

These exceedances of the perchlorate ESV indicates that perchlorate will be retained for further consideration in this refined SLERA.

3.3.6.2 Dioxin/Furans

Location-specific dioxin/furan concentrations from the OU-1 Refined SLERA Area by spatial unit are illustrated on Figures 3-2a and 3-2b for mammal and bird TEQ, respectively. Individual data are also illustrated on Figures 3-2c. As shown on Figure 3-2a, 3-2b, and 3-2c, dioxin/furan concentrations consistently exceeded USEPA's Region 4 ESVs, with screening HQs of 3,000 to 10,000 (Table 3-1a). Of the 242 samples (including duplicates) collected in the OU-1 Refined SLERA Area, 173 samples (71%) exceeded the USEPA Region 4 ESV of 0.000016 milligram per kilogram (mg/kg) for birds and 192 samples (79%) exceeded the USEPA Region 4 ESV of 0.0000035 mg/kg for mammals. The greatest number of exceedances occur in Eco DU-1. As illustrated, the northern section of Eco DU-1, particularly around the GW-11 Pond, appears to contain the highest concentrations of dioxins/furans. The dioxin/furan mammal and bird TEQs were much lower in Parcel E compared to DU-1, with Parcel E dioxin/furan HQs ranging from 20 to 40 for mammals and birds, respectively. For this reason, dioxins/furans are carried further in this OU-1 Refined SLERA.

3.3.6.3 Metals

The spatial plots provided in the Figure 3-3 series are provided for metals with HQ greater than 1 (Figure 3-3a to Figure 3-3n): antimony, arsenic, boron, cadmium, chromium, cobalt, copper, iron, lead, manganese, mercury, molybdenum, selenium, and vanadium. As can be seen on the Figure 3-3 series, many of the metals were detected at concentrations lower

than the lowest ESV, with only limited numbers of exceedances of ESVs. Those metals with concentrations exceeding ESVs are considered further in this OU-1 Refined SLERA. There are notable observations for iron and manganese, as follows:

- Iron: The iron ESV is a very low value based on exposures for microbes, resulting in HQs of 700 for the Operations Area and 80 for Parcel E.
- Manganese: As can be seen on Table 3-1a and Figures 3-3j-1 and 3-3j-2, manganese concentrations consistently exceed the Eco-SSL plant ESV of 220 mg/kg. Of the 222 samples collected in the OU-1 Refined SLERA Area (214 in the Operations Area and 8 in Parcel E including duplicates), 213 samples (96%) exceeded the Eco-SSL plant ESV. As illustrated, manganese in soils appear to be well distributed throughout the Operations Area at lower concentrations, with the highest concentration which yielded the screening HQ of 1,000 seen from a surface soil sample in the eastern side of DU-1, from sample location RIT 3-03 collected near the Leasehold debris pile (Figures 3-3j-1, 3-3j-2).

3.3.6.4 SVOCs

Five SVOCs had HQs exceeding 1 in the Operations Area (Table 3-1a and Figures 3-4a to 3-4e):

- 2-chlorophenol (HQ of 3), 3&4 methylphenol (HQ of 2), bis 2-ethylhexylphthalate (HQ of 40), di-n-butylphthalate (HQ of 200), and total PAHs (HQ of 2).
- These SVOCs with concentrations exceeding ESVs are considered further in this refined SLERA.

3.3.6.5 VOCs

- Acetone and chloroform were the only VOCs detected, with HQs of 2 and 3, respectively (Table 3-1a and Figure 3-5a and 3-5b).
- These VOCs with concentrations exceeding ESVs are considered further in this refined SLERA.

3.3.6.6 Pesticides

Spatial plots are provided for nine pesticides, as indicated on Table 3-1a, Table 3-1b, and Figures 3-6a to 3-6i. Each of these pesticides are considered further in this OU-1 Refined SLERA.

- Among the pesticides, beta-benzene hexachloride (BHC) had the highest HQ (3,000) (Figure 3-6b). The highest concentrations of beta-BHC were seen in Eco DU-1. The remaining HQs were lower and each of these pesticides were carried forward in the risk assessment process.
- Alpha-BHC (Figure 3-6a) and methoxychlor (Figure 3-6i) were detected in 2 of 126 samples, less than 2% of the samples. The spatial plot for methoxychlor also shows the detection limits that exceed the ESVs.

3.3.6.7 PCBs and Petroleum Hydrocarbons

- Figures 3-7a to 3-7e provide spatial plots for PCBs as Aroclors and as mammal and bird PCB TEQ.

- Figures 3-8a to 3-8d provide spatial plots for petroleum hydrocarbons, such as oil range organics, diesel, and long carbon chain organics.

3.4 SMDP for the OU-1 Refined SLERA

Consistent with USEPA (1997) guidance, the screening provided in Steps 1 and 2 demonstrate that many chemicals do not pose unacceptable risks and do not require further consideration. However, numerous constituents do require further assessment consideration in the refined screening provided in Section 4 of this report (i.e., Step 3a of the USEPA eight-step ERA process; Figure 1-6). The summary of constituents to be carried forward into Step 3a for the Operations Area and Parcel E, respectively, are provided on Tables 3-3a through 3-3e, respectively.

4. STEP 3A: REFINED SCREENING AND UNCERTAINTY ASSESSMENT

The screening refinement is designed to refine the list of COPECs identified following the initial screening in Section 3.2 and to identify the nature and extent of ecological risks more realistically in order to support informed environmental management decisions (USEPA 1997). This contrasts with the screening steps, which are designed to conservatively rule out further evaluation of chemicals and media that clearly do not pose significant ecological risk.

The refined SLERA methodology presented in this section is consistent with the following guidance:

- Ecological Risk Assessment Guidance for Superfund (USEPA 1997).
- Guidelines for Ecological Risk Assessment (USEPA 1998).
- ECO-Update: Role of Screening-Level Risk Assessments and Refining Contaminants of Concern in Baseline Ecological Risk Assessments (USEPA 2001).
- NDEP Screening-Level Ecological Risk Assessment Guidelines for the BMI Complex, Henderson, Nevada (NDEP 2006).

COPECs identified in the refined SLERA are evaluated further in the refined SLERA problem formulation using refined estimates of exposure and effects. The refinements provide a more realistic understanding of exposures and potential ecological risks to help inform further assessment or management decisions. Risks are recalculated using the refined assumptions in an iterative process that determines the constituents, media, and pathways that are of primary concern within the OU-1 Refined SLERA Area. The refinement of the COPECs identified in the refined SLERA is necessary to help focus the risk assessment on chemicals that may truly contribute to risk. The remainder of this section is organized as follows:

- Section 4.1 provides the refined EPC used in Step 3a.
- Section 4.2 summarizes the assessment endpoints considered in the refined SLERA.
- Section 4.3 identifies the measurement endpoints used to refine COPECs.
- Section 4.4 describes the refinement of COPECs for direct contact pathways.
- Section 4.5 describes the evaluation of food web pathways.
- Section 4.6 provides the results of the refinements (the risk characterization).
- Section 4.7 provides a characterization of uncertainties in the refined SLERA evaluation.

4.1 Refined Exposure Point Concentrations

The use of maximum concentrations in the screening-level evaluation are not necessarily indicative of true exposures (e.g., receptors are unlikely to be exposed to the highest levels of all COPECs at all times). Therefore, 95% UCL soil concentrations are also considered as a refinement of the exposure point concentration (EPCs) for the evaluation of potential risks to ecological receptors.

The 95% UCLs were calculated for compounds that exceeded conservative ESVs using R Code provided by Neptune, with non-detected results included as one-half the SQL. The higher UCL value generated between the bias-corrected accelerated bootstrap method (BCA UCL) and the Student's t-test method was selected. In instances where the selected UCL was higher than the maximum detected concentration for a chemical, then the maximum detected concentration was used as a surrogate in the screening process. Neptune provided Ramboll with a copy of the R codes used for the UCL calculation on May 18, 2020.

Results from the screening using the 95% UCLs are summarized in Table 4-1a for the Operations Area, 4-1b for Eco DU-1, 4-1c for Eco DU-2, 4-1d for Eco DU-3, and 4-1e for Parcel E. Appendix F provides a summary of the 95% UCLs for the constituents retained in the refined SLERA according to each of the five spatial units.

4.1.1 Chemicals Retained for Further Evaluation

The chemicals retained from Tier 1 screening were screened again using 95% UCL concentrations instead of concentrations. The results of the Tier 2 screening sorted the chemicals into three groups.

- Detected chemicals where the 95% UCL HQ was less than or equal to 1 were removed from the risk assessment process.
- Detected chemicals where the 95% UCL HQ was greater than 1 were subject to further analysis by either food web evaluation, evaluation of direct toxicity to plants and/or invertebrates, or analysis in the Uncertainty Assessment.
- Detected Chemicals with no ESVs and non-detected chemicals where the max SQL was greater than the ESV were subject to further analysis in the Uncertainty Assessment.

The chemicals retained for further analysis are as follows:

Exhibit 4-1. Number of Chemicals (or Groups of Chemicals) Retained for Further Evaluation

	Op Area	Eco DU-1	Eco DU-2	Eco DU-3	Parcel E
# Chemicals Retained from Tier 1 Screening	**98**	**95**	**51**	**43**	**32**
# Chemicals Removed from screening because 95% UCL HQ≤1	18	17	2	0	0
# Chemicals Retained for Further Analysis	**80**	**78**	**49**	**43**	**32**
Reasons for Retention					
Food web, direct contact, or frequency analysis because 95% UCL HQ > 1	25	25	14	10	5
Uncertainty Assessment Max SQL HQ > 1	33	33	26	25	22
Uncertainty Assessment (Detected, No ESV)	22	20	9	8	5
Highest 95% UCL HQ (among detected chemicals)	1,000	1,000	100	5,000	40

Notes:
ecological decision unit (Eco DU); ecological screening value (ESV); hazard quotient (HQ); sample quantitation limit (SQL); upper confidence limit of the mean (UCL).

- **Operations Area:** Table 4-2a shows 98 chemicals were retained from the initial screening. Of those, 18 were removed from further screening because their 95% UCL HQs were less than or equal to 1. 80 chemicals were retained for further evaluation

in the food web model, direct contact toxicity analysis, or analysis of frequency of detection in the Uncertainty Assessment. Of those, 25 chemicals were retained because their 95% UCL HQ was greater than 1, and the highest 95% UCL HQ for detected chemicals in the Operations Area was 1,000. 33 chemicals were not detected and had SQLs higher than their ESVs and 22 chemicals were detected but had no ESVs.

- **Eco DU-1:** Table 4-2b shows 95 chemicals were retained from the initial screening. Of those, 17 were removed from further screening because their 95% UCL HQs were less than or equal to 1. 78 chemicals were retained for further evaluation in the food web model, direct contact toxicity analysis, or analysis of frequency of detection in the Uncertainty Assessment. Of those, 25 chemicals were retained because their 95% UCL HQ was greater than 1, and the highest 95% UCL HQ for detected chemicals in the Operations Area was 1,000. 33 chemicals were not detected and had SQLs higher than their ESVs and 20 chemicals were detected but had no ESVs.
- **Eco DU-2:** Table 4-2c shows 51 chemicals were retained from the initial screening. Of those, two were removed from further screening because their 95% UCL HQs were less than or equal to 1. 49 chemicals were retained for further evaluation in the food web model, direct contact toxicity analysis, or analysis of frequency of detection in the Uncertainty Assessment. Of those, 14 chemicals were retained because their 95% UCL HQ was greater than 1, and the highest 95% UCL HQ for detected chemicals in the Operations Area was 100. 26 chemicals were not detected and had SQLs higher than their ESVs and 9 chemicals were detected but had no ESVs.
- **Eco DU-3:** Table 4-2d shows 43 chemicals were retained from the initial screening. Of those, none were removed from further screening because their 95% UCL HQs were less than or equal to 1. 43 chemicals were retained for further evaluation in the food web model, direct contact toxicity analysis, or analysis of frequency of detection in the Uncertainty Assessment. Of those, 10 chemicals were retained because their 95% UCL HQ was greater than 1, and the highest 95% UCL HQ for detected chemicals in the Operations Area was 5,000. 25 chemicals were not detected and had SQLs higher than their ESVs and 8 chemicals were detected but had no ESVs.
- **Parcel E:** Table 4-2e shows 32 chemicals were retained from the initial screening. Of those, none were removed from further screening because their 95% UCL HQs were less than or equal to 1. 32 chemicals were retained for further evaluation in the food web model, direct contact toxicity analysis, or analysis of frequency of detection in the Uncertainty Assessment. Of those, 5 chemicals were retained because their 95% UCL HQ was greater than 1, and the highest 95% UCL HQ for detected chemicals in the Operations Area was 40. 22 chemicals were not detected and had SQLs higher than their ESVs and 5 chemicals were detected but had no ESVs.

Constituents with 95% UCL HQs greater than 1 are carried forward into a risk characterization for plants, soil invertebrates, and wildlife where the assumptions responsible for these HQs were re-evaluated. Chemicals that, at this point in the process, lack a reliable and appropriate ESV are also carried forward into Step 3a. Chemicals carried

forward for evaluation of direct contact pathways for plants and soil invertebrates and/or the food web model for birds and mammals for the Operations Area, Eco DU-1, Eco DU-2, Eco DU-3, and Parcel E are provided in Tables 4-2a, 4-2b, 4-2c, 4-2d, and 4-2e, respectively. Radionuclides were not retained for further analysis and are excluded as COPECs from the OU-1 Refined SLERA because either the radionuclides in the OU-1 Refined SLERA Area soils were not detected, the concentrations of radionuclides in the OU-1 Refined SLERA Area soils were below background concentrations, or maximum HQs were below 1.

The constituents listed below do not have ESVs from the hierarchy of available USEPA ESV sources identified in this OU-1 Refined SLERA report. With the exception of octachlorostyrene, these chemicals are not considered bioaccumulative, so uptake via the wildlife food web is considered unlikely. These chemicals are summarized below in Exhibit 4-2 and are discussed further as an uncertainty in Section 4.7 of this report.

Exhibit 4-2. Constituents Lacking ESVs Considered Further in Uncertainty Assessment

• Ammonia	• Methyl tert-butyl ether
• Bromide	• Nitrate/Nitrite
• Bromodichloromethane	• Sulfate/Sulfur
• Chlorate	• Octachlorosytrene
• Chloromethane	• Ortho-phosphate
• Dimethoate	• Stirophos
• Ethyl tert-butyl ether	• tert-Butyl alcohol
• Formaldehyde	• 2-Chloronaphthalene
• Isophorone	• 4-Chloro-3-methylphenol
• Magnesium	

The chemicals and their respective EPCs retained for additional evaluation using a direct contact pathway for plants and soil invertebrates and a food web model for wildlife within each of the five spatial units are presented in Tables 4-3a through 4-3e. These constituents are discussed further in this section through consideration of potential exposures and risks to plants and soil invertebrates, via uptake to birds and mammals through the food web, or both.

4.2 Assessment Endpoints Considered for the Screening Refinement

The assessment endpoints identified in Section 2.1.8 are those considered in the refinement steps. However, whereas the screening uses the most conservative ESV regardless of ecological receptor group to eliminate or retain COPECs, this refinement allows for the evaluation of each receptor group shown below separately in order to focus risk management decision-making on those chemicals and receptors, if any, that may truly pose a risk. The assessment endpoints by receptor considered in the refinement are listed in Exhibit 4-3.

Exhibit 4-3. Assessment Endpoints	
Ecological Receptor	**Assessment Endpoint**
Terrestrial plant communities	Survival, growth, and function
Terrestrial invertebrate communities	
Terrestrial mammal populations	Survival, growth, and reproductive ability
Terrestrial bird populations	
Reptile populations	

4.3 Measurement Endpoints Used to Refine COPECs

The risk characterization of COPECs is based on the quantitative measurement endpoints described below.

Potential risks to plants and soil invertebrates exposed to the constituents in OU-1 Refined SLERA Area soils (which includes the Operations Area, the three Eco DUs, and Parcel E) were evaluated. For this evaluation of plants and soil invertebrates:

- The maximum and central tendency exposure concentrations of constituents detected in the OU-1 Refined SLERA Area are compared to ESVs that are specifically focused on plants and soil invertebrates. For these terrestrial communities, refined ecological benchmarks relevant for these receptor groups were used instead of the generic screening values used in the refined SLERA which may be based on receptors irrelevant to the OU-1 Refined SLERA Area. The ESVs and the refined screening values (RSVs) are provided in Table 4-4.
- HQs for plants and soil invertebrates are calculated using maximum and central tendency (95% UCL and AVG) soil concentrations.
- As necessary to illustrate exposure and potential impacts (if any), the full data distributions for some constituents are discussed as they relate to the plant and soil invertebrate ESVs.
- Potential risks to bird, mammal, and reptile populations exposed to the constituents in OU-1 Refined SLERA Area soils is evaluated as follows:
    - Food web modeling is performed for bioaccumulative constituents using maximum and central tendency exposure concentrations for the four bird species and five mammal species that may live and forage in the OU-1 Refined SLERA Area listed in Section 4.5.1. The species selected for the food web model represent herbivorous, omnivorous, insectivorous, and carnivorous feeding (trophic) guilds within the food web.
    - The food web model is performed using NOAEL and lowest adverse effects level (LOAEL) TRVs for birds and mammals.
    - As necessary to illustrate exposure and potential impacts (if any) for birds and mammals, the full data distributions for some constituents are discussed as they related to bird and mammal exposures.
    - The food web model evaluation also considers conservative, protective assumptions. For example, it was assumed that birds and mammals live and

forage only in the OU-1 Refined SLERA Area. In addition, more realistic assumptions are considered for some of the birds and mammals with larger home ranges.

- There are no specific ESVs for reptiles, but the evaluations for plants, soil invertebrates, birds, and mammals, inform an understanding of potential risks for reptiles.

4.4 Risk Characterization to Plants and Soil Invertebrates Via Direct Contact Pathways

The refinement of COPECs for direct contact pathways is discussed in terms of the following assessment endpoints:

- Terrestrial plant community survival, growth, and function
- Terrestrial invertebrate community survival, growth, and function

The constituents in soil with a 95% UCL detected concentration retained in Section 4.1.1 and listed in Tables 4-2a through 4-2e were evaluated for this direct contact pathway refinement specific to plants and invertebrates, to the extent that plant and terrestrial invertebrate ecological benchmarks were available for consideration of these receptor groups. The discussion below describes the refined effects and exposure assessment and the refined risk characterization for the terrestrial plant and invertebrate community.

Efforts were made to identify ESVs specific to plants and invertebrates. As noted above, there are not ESVs for plants and invertebrates for all constituents detected. For those chemicals without a plant- or invertebrate-specific ESV, the chemical was evaluated qualitatively in the uncertainty section.

For some chemicals like dioxins and furans, numerous studies have documented that invertebrates are not sensitive to dioxins and furans because they lack the aryl hydrocarbon receptor (AhR) upon which toxicity is exerted (West et al. 1997, Hahn et al. 1994, Borgmann et al. 1990). As such, these chemicals are not evaluated in the plant or invertebrate screening. Although the studies did not note a sensitivity to dioxins and furans for plants or invertebrates, West et al. (1997) did note the ability of invertebrates to accumulate relatively high concentrations of dioxins and furans in the absence of toxic effects which may be relevant to the transfer of these chemicals through the food web. Therefore, although the uptake of dioxins and furans through invertebrates is not considered in the invertebrate-specific screening, it is considered for the food web evaluation.

4.4.1 Refined Risk Calculations for Plants Via Direct Contact Pathways

The refined screening for direct contact pathways provides the evaluation for the terrestrial plant communities. The refined screening for each of these evaluations was performed for each of the five spatial units identified for the OU-1 Refined SLERA for the COPECs identified in Tables 4-2a through 4-2e as follows:

$$HQ = \frac{\text{Maximum or 95\% UCL Concentration}}{\text{Refined Ecological Effects Data}}$$

Similar to the screening evaluation, refined HQs less than or equal to the threshold value of 1 indicate that the chemical does not pose an unacceptable risk. HQs that exceed the threshold value of 1 indicate a potentially unacceptable risk, although closer consideration

may be warranted to understand whether this is the case (e.g., the magnitude of the HQ and the spatial distribution of elevated HQs), including the basis of the ecological benchmark and other considerations, such as qualitative observations in areas where samples were collected. Refined Risk Calculations for Plants Via Direct Contact Pathways

HQs for plants are provided on Table 4-5a through 4-5e for each of the five spatial units defined in the OU-1 Refined SLERA Area. The results for each of the five spatial units are provided separately below.

The following figures illustrate the risk results using RSVs specific to plants:

- Figure 4-1: Spatial Concentration Plot for Perchlorate in Surface Soil using the RSV for Plants
- Figure 4-2: Spatial Concentration Plot for Manganese in Surface Soil using the RSV for Plants
- Figure 4-3: Spatial Concentration Plot for beta-BHC in Surface Soil using the RSV for Plants
- Figure 4-4: Spatial Concentration Plot for Boron in Surface Soil using the RSV for Plants
- Figure 4-5: Spatial Concentration Plot for Extractable Fuel Hydrocarbons (EFH; C10-C40) in Surface Soil using the RSV for Plants

4.4.1.1 Operations Area

HQs are less than or equal to 1 for constituents with plant-specific ESVs using the maximum concentrations, except for perchlorate, boron, lead, manganese, mercury, beta-BHC, and extractable fuel hydrocarbons (EFH) (C10-C40) (Table 4-5a). HQs are less than or equal to 1 for constituents with plant specific ESVs using the 95% UCL concentrations, except for perchlorate (UCL NOAEL HQ=4), manganese (HQ=40), and EFH (C10-C40; HQ=2). Perchlorate and manganese are evaluated using location-specific HQs in Appendix G-1 as these are the two constituents with the highest plant HQs. Constituents with HQs that exceed 1 are discussed below. The table provided below identifies the chemicals that have HQs greater than 1, as provided in Table 4-5a.

A set of HQs using ESVs and RSVs are provided for perchlorate, boron, manganese beta-BHC, and EFH (Table 4-5a), as these were the chemicals with the higher plant HQs. Lead and mercury have HQs greater than 1 when using soil concentrations but HQs are less than 1 when using the 95% UCL soil concentrations.

For perchlorate, one ESV is the NOAEL taken from the LANL database, and the other is the LOAEL value taken from the LANL database and treated as an RSV. Using the RSV, perchlorate has a LOAEL UCL HQ of 2. An excerpt from Table 4-5a provided below shows the set of HQs for perchlorate using these two screening values, as well as the HQs for the other constituents where the maximum or UCL HQ exceeds 1. The results suggest that there may be a risk to plants within the Operations Area from exposure to perchlorate. Figure 4-1 provides a summary of the perchlorate concentrations by Eco DU and the associated screening value for plants. As can be seen, the perchlorate concentration pattern relative to ESVs is very different for plants (Figure 4-1) vs the lowest ESV (Figure 3-1a). Perchlorate is considered further with regard to other receptors, but these results indicate limited risks to plants from perchlorate.

For manganese, the ESV and RSV used in Table 4-5a were obtained from the USEPA Eco-SSLs. The RSV is based on a toxicity value of 707 mg/kg for less-sensitive plant species (i.e., cotton and Nile grass), as provided in the USEPA (2007e) Eco-SSL derivation for terrestrial plants. Using the RSV, manganese has a maximum HQ of 400. An excerpt from Table 4-5a provided below shows the set of HQs for manganese using these two screening values, where the UCL HQ suggests that that there may be a risk to plants within the Operations Area from exposure to manganese. Figure 4-2 provides a summary of the manganese concentrations by Eco DU and the associated screening value for plants. As can be seen in Figure 4-2, the majority of concentrations detected were less than or similar to the plant ESV, indicating that manganese risks to plants are not expected.

For beta-BHC, the ESV and RSV used in Table 4-5a are the plant-specific NOAEL and LOAEL, respectively, for gamma-BHC taken from the LANL database. Gamma-BHC is used as a surrogate chemical due to the lack of an ESV specific to beta-BHC. Using the RSV, beta-BHC has a maximum LOAEL HQ of 0.9. An excerpt from Table 4-5a provided below shows the set of HQs for beta-BHC using these two screening values. The UCL HQ using either the ESV or the RSV suggests that risk to plants from exposure to beta-BHC is *de minimis*. The spatial plot of beta-BHC vs plant ESVs is provided in Figure 4-3.

For boron, the ESV is the Region 4 plant specific ESV and is based on the LANL model for the "plant generic autotroph" receptor. LANL used the geomean of three survival and development studies to derive the No Observable Effect Concentration (NOEC) Lowest Observable Effect Concentration (LOEC) TRVs for boron (LANL 2017, "TRV Summary Report for Boron" for the plant generic autotroph receptor). In these studies, boron uptake was specifically via the seed coat and/or roots so the exposure routes were comparable to actual exposures at OU-1. LANL states that confidence in this value is "medium" because of the paucity of data, the limited numbers of organisms tested, and the wide variability in the data. This value was last updated in 2003 and does not account for any literature posted in the last 20 years. The spatial plot of boron concentrations relative to the plant ESV is provided in Figure 4-4. As indicated on Figure 4-4, with limited exception, the detections of boron are similar to the ESV, indicating that boron risks to plants are not expected.

For EFH (C10-C40), the ESV and RSV used in Table 4-5a are the plant-specific NOAEL and LOAEL, respectively, from the LANL database. Using the RSV, EFH has a LOAEL HQ of 2. A spatial plot for EFH is provided in Figure 4-5. An excerpt from Table 4-5a (Exhibit 4-4a) provided below shows the set of HQs for EFH using these two screening values. The UCL HQ using the ESV is 2, but the UCL HQ using the RSV is 0.4 suggesting that risk to plants from exposure to EFH is *de minimis*.

The results using the 95% UCL concentrations from within the Operations Area indicate that there are potential risks to plants within the Operations Area through potential exposure to perchlorate and manganese (Exhibit 4-4a).

Exhibit 4-4a. Chemicals with HQs Greater Than 1 for Plants (Operations Area)					
Chemical	**Source**	**HQs (Identified in Table 4-5a)**

100	10 < HQ ≤ 100
1,000	100 < HQ

4.4.1.2 Eco DU-1

Eco DU results are summarized in Exhibit 4-4b below. The same constituents with HQs>1 in the Operations Area have HQs>1 in Eco DU-1 for both the maximum and 95% UCL soil concentrations (Table 4-5b) except for boron where the 95% UCL soil concentration in DU-1 leads to a HQ of 2, whereas it is 1 in the Operations Area. In fact, 95% UCL HQs for perchlorate, lead, manganese, mercury, and EFH were the same as those for the Operations Area as shown in the excerpt of Table 4-5a provided above. Perchlorate and manganese may present a potential risk to plants within Eco DU-1.

4.4.1.3 Eco DU-2

HQs are less than 1 for constituents with plant-specific ESVs using the maximum concentrations, except for boron and beta-BHC (Table 4-5c) when using the most

conservative plant specific ESV. Maximum HQs are less than or equal to 1 using the RSVs for boron and BHC. HQs are less than1 for all constituents using the 95% UCL concentrations and plant specific ESVs.

4.4.1.4 Eco DU-3

HQs are less than 1 for constituents with plant specific ESVs using the maximum concentrations and 95% UCL except for perchlorate with a maximum HQ of 40 and a 95% UCL HQ of 20 (Table 4-5d). Using the RSV, the maximum and 95% UCL HQs are 20 and 8, respectively.

4.4.1.5 Parcel E

HQs are less than 1 for all constituents evaluated in Parcel E with plant-specific ESVs using the maximum and the 95% UCL concentrations (Table 4-5e).

Exhibit 4-4b. Chemicals with a HQ Greater Than 1 for Plants by Decision Unit

Chemical Name	Source (ESVs & RSVs)	(Identified in Tables 4-5a through 4-5e) UCL / ESV and RSV Risk Results for Terrestrial Plants

4.4.1.6 Conclusions

Overall, there is minimal risk to plants due to chemicals in the soil in Eco DU-2 and Parcel E. However, the results for the Operations Area, which includes the three additional Eco DUs, indicate that two constituents (perchlorate and manganese) may pose unacceptable risks to plants. On a spatial unit specific basis, results indicate that perchlorate and manganese potentially present a risk to plants in Eco DU-1, and perchlorate may present a risk to plants in Eco DU-3.

Perchlorate and manganese were detected at a frequency of 96% and 100%, respectively (Table 3-1a). While overall Eco DU-1 is the area where the greatest potential risk may occur to terrestrial plants, the UCL HQ for perchlorate is highest in Eco DU-3 (UCL RSV HQ = 8). The presence of plants in general is sparse and no special status plants are present in OU-1.

Perchlorate may pose a risk to plants in areas with the highest detected concentrations. Figure 4-1 shows the perchlorate concentrations by sample location for each Eco DU compared to the RSV. As illustrated, perchlorate concentrations are below the plant RSVs in Parcel E and Eco DU-2 indicating that perchlorate in these spatial units does not likely pose an unacceptable risk to terrestrial plants. As indicated in Figure 4-1, there are some locations in Eco DU-1 near the Former Ammonium Perchlorate Plant that exceed the RSV for plants, which suggests that these areas could potentially impact plants.

Manganese does not likely pose a risk to plants except in areas with the highest concentrations in DU-1, as is illustrated on Figure 4-2. The manganese USEPA Eco-SSL for terrestrial plants is based on a geomean of four toxicity values acquired from three available studies (USEPA 2007e). The soil in one study (Reid 1965, as cited in USEPA 2007e), based on toxicity to barley (*Hordeum vulgare*), contained a very low concentration (0.78%) of organic matter. Soil toxicity values of 71 mg/kg were derived using each of two different soil pH (4.6 and 7.3), indicating that pH had no effect on the toxicity of manganese to barley. Similarly, pH was varied in two additional studies on terrestrial plants (Rehab and Wallace 1978 and Foy et al. 1998, as cited in USEPA 2007e), but the toxicity to both cotton (*Bossypium* spp.) and Nile grass (*Heroceras macrum*) was the same (i.e., 707 mg/kg). Organic matter was also varied in the Rehab and Wallace (1978) and Foy et al. (1998) studies as cited in USPEA 2007e, but because the toxicity values were identical, it is unlikely that the organic matter content is a determining factor in manganese toxicity in soil. However, it is known that barley is a sensitive crop species to manganese (Fuhrs et al. 2010), so including the toxicity values for barley in the Eco-SSL derivation for manganese very likely biases the Eco-SSL for manganese low. As such, for this OU-1 Refined SLERA, the toxicity values for the less-sensitive plant species (i.e., 707 mg/kg) is provided as an

USEPA Eco-SSL RSV in Figure 4-2. Therefore, manganese is not identified as a chemical for future risk management consideration based on concerns for plants in Eco DU-2, Eco DU-3, or Parcel E. However, manganese is identified for future risk management consideration based on concerns for plants for DU-1 where there are 51 samples with concentrations that exceed the RSV.

It is possible that sensitive plants may experience adverse impacts at the locations with the highest concentrations of perchlorate and manganese, however, while individual plants could be impacted in a small area, the plant community would not be adversely impacted from exposure within this area. Some constituents lack plant ESVs, as identified on Tables 4-5a through 4-5e. These are discussed as an uncertainty in the uncertainty evaluation.

4.4.2 Refined Risk Calculations for Invertebrates Via Direct Contact Pathways

HQs for terrestrial invertebrates are provided on Table 4-6a through 4-6e for each of the five spatial units defined within the OU-1 Refined SLERA Area. The results for each of the five spatial units are discussed below. An excerpt of Table 4-6a showing the AVG, 95% UCL and maximum HQs for the Operations Area and an excerpt of Tables 4-6a through 4-6e showing the 95% UCL HQs for each of the five spatial units are provided below.

The following figures illustrate the risk results using RSVs specific to invertebrates:

- Figure 4-6: Spatial Concentration Plot for Perchlorate using the RSV
- Figure 4-7: Spatial Concentration Plot for Manganese using the RSV
- Figure 4-8: Spatial Concentration Plot for 4,4'-DDE using the RSV
- Figure 4-9: Spatial Concentration Plot for 4,4'-DDT using the RSV
- Figure 4-10: Spatial Concentration Plot for Calculated DDx using the RSV
- Figure 4-11: Spatial Concentration Plot for beta-BHC using the RSV
- Figure 4-12: Spatial Concentration Plot for EFH (C10-C40) using the RSV

4.4.2.1 Operations Area

Using the maximum concentrations and invertebrate-specific ESVs the following constituents had HQs that exceed 1: perchlorate, manganese, mercury, 4,4'-DDE, 4,4'-DDT, DDx, beta-BHC, Total PCBs, di-n-butylphthalate, and EFH (C10-C40).

- Using the 95% UCL concentrations, HQs exceeded 1 for perchlorate, manganese, mercury, and beta-BHC. These chemicals were evaluated using location-specific HQs in Appendix G-2.
- As can be seen on the except from Table 4-6a below, there are two sets of HQs for perchlorate, manganese, DDE, DDT, DDx, beta-BHC, and EFH.
    - For perchlorate, the ESV is a NOAEL taken from the LANL database for earthworms resulting in a maximum HQ of 1,000 and a 95% UCL HQ of 50. Using a LOAEL value as an RSV, also from the LANL database, the maximum HQ was 100 and the 95% UCL HQ was 5 for the Operations Area. Figure 4-6 provides the spatial plot for perchlorate using the LANL LOAEL RSV.
    - For manganese, the USEPA Eco-SSL for terrestrial invertebrates is based on a geomean of three toxicity values acquired from three available studies (USEPA

2007e). The three studies are based on potworms (*Enchytraeus crypticus*; Kuperman et al. 2002, as cited in USEPA 2007e), springtails (*Folsomia candida*; Phillips et al. 2002, as cited in USEPA 2007e), and earthworms (*Eisenia fetida*; Simini et al. 2002, as cited in USEPA 2007e), and provide manganese soil toxicity values of 116 mg/kg, 1,209 mg/kg, and 629 mg/kg, respectively. Because the soil within OU-1 is mostly compacted, it is unlikely that either potworms or earthworms—both small, burrowing species—would be abundant or even present in OU-1 soil. Springtails, on the other hand, do not burrow deep in the soil and are generally ubiquitous; they may be present in OU-1 soil. Therefore, the toxicity value for manganese of 1,209 mg/kg, which was derived using springtails, is provided as an USEPA Eco-SSL RSV. Figure 4-7 provides the spatial plot for manganese using the USEPA Eco-SSL RSV. Using this RSV, manganese has a 95% UCL HQ of 7 within the Operations Area. This RSV was selected based on a literature review to find toxicity studies other than the conservative value identified by USEPA (2007b) for manganese. Google Scholar was searched for research papers specifically pertaining to exposure of soil invertebrates to manganese written from 1990 to present. 33 papers were reviewed. Most of the papers regarding the toxicity of manganese to soil invertebrates focused on metabolomic or genetic effects on worms. Some of these papers using worms focused on the relationship between manganese and human diseases such a Parkinson's and Alzheimer's. Whole-worm toxicity testing information was sparse. The other papers reviewed were not useful for a variety of reasons including the studies not being relevant to actual soil exposures, use of biochemical endpoints such as upregulation of proteins, or biomarkers of exposure such as molecular or histologic tests versus survival, growth, or reproductive endpoints typically used in ERAs. As such, the supplemental EC20 based on impacts to reproductive endpoints from Phillips et al. (2002) was used as the RSV.

- Beta-BHC reflects the highest HQs, with HQs of 3,000 using the maximum EPC, 200 using the 95% UCL EPC and 100 using the average EPC. The 95% UCL BHC soil concentration is 0.06 mg/kg. The USEPA Region 4 ESV for soil invertebrates (0.0003 mg/kg) is not directly based on a study of toxicity for soil invertebrates. Rather, it is based on predicted toxicity from an ecological structure-activity relationship soil model which is a threshold for no adverse effects. USEPA guidance identifies ESVs and RSVs for many constituents but does not provide an RSV for beta-BHC specific to soil invertebrates. Therefore, a literature review was conducted to find toxicity studies other than the conservative ESV reported by USEPA Region 4. A broad search resulted in 1,380 results, but virtually all of the papers were prepared from 1950 to 1970 when this pesticide was in use. As such the research is very old and may not reflect modern good laboratory practices. In a review paper prepared by Edwards and Bohlen (1992) the authors report concentrations of BHC applied in the lab to earthworms. The various studies included concentration ranges from 0.075 to 800 mg/kg. The authors reported low toxicity of BHC to invertebrates (Gunthart 1947; Morrison 1950; Prisaznyuk 1950; Polivka 1951; Grigoreva 1952; Richter 1953; Weber 1953; Lipa 1958; Ghilarov and Byzova 1961) except at the highest concentrations. The study from Novais et al. 2010 is a toxicity study conducted on soil invertebrates.

Novais et al. (2010) exposed soil invertebrates to BHC. Novais et al. (2010) reported that there were no reproductive impairments at 18 mg/kg (of gamma BHC, the most toxic form) and no mortality at 5.6 mg/kg of beta-BHC for the potworm (soil invertebrate) after a 42-day exposure. The Novais et al. (2010) study is used as an RSV for this OU-1 Refined SLERA. The detected concentrations of beta-BHC are well below the soil invertebrate RSV of 5.6 mg/kg, and the RSV 95% UCL HQ is well below 1. Figure 4-11 provides the spatial plot for beta-BHC using the Novais et al. (2010) RSV.

- For EFH (C10-C40), the ESV and RSV used in Table 4-6a are the invertebrate-specific NOAEL and LOAEL, respectively, from the LANL database. Using the invertebrate specific ESV, the HQ using the maximum and 95% UCL soil concentrations are 5 and 0.9, respectively. Using the RSV, EFH has an HQ of 0.5 and a UCL HQ of 0.09, suggesting that risk to plants from exposure to EFH is de minimis. Figure 4-12 provides the spatial plot for EFH (C10-C40) using the LOAEL RSV.

- Considering RSVs, the only constituents of concern which may pose a risk to invertebrates in the Operations Area are perchlorate, manganese, and mercury (see Exhibit 4-5 below).

4.4.2.2 Eco DU-1

The same constituents with HQs>1 in the Operations Area have HQs>1 in Eco DU-1 using the maximum soil concentrations, as indicated in Exhibit 4-6 below. These include perchlorate, manganese, mercury, 4,4'-DDE, 4,4'-DDT, DDx, beta-BHC, Total PCBs, di-n-butylphthalate, and EFH. The constituents with HQs>1 using the 95% UCL soil concentration from within Eco DU-1 are the same as those for the Operations Area, including perchlorate, manganese, mercury, and beta-BHC, in addition to DDx (Table 4-6b). The perchlorate UCL HQ within OU-1 is 40 versus 50 within the Operations Area when using the ESV. The RSV HQs for DDx and beta-BHC are below 1. 95% UCL HQs using RSVs are greater than 1 for perchlorate (HQ=4), manganese (HQ=7), and mercury (HQ=2).

4.4.2.3 Eco DU-2

HQs using maximum soil concentrations from within Eco DU-2 using conservative invertebrate specific ESVs exceeded 1 for perchlorate, 4,4'-DDE, 4,4'-DDT, DDx, and beta-BHC (Table 4-6c). However, maximum HQs are less than or equal to 1 using the RSVs for each of the constituents listed above. HQs using 95% UCL soil concentrations and invertebrate-specific ESVs, HQs exceed 1 for perchlorate, 4,4'-DDE, DDx, and beta-BHC. HQs are less than or equal to 1 for all constituents evaluated in Eco DU-2 with invertebrate-specific RSVs using the maximum or 95% UCL soil concentrations (Table 4-6c).

4.4.2.4 Eco DU-3

HQs are less than or equal to 1 for constituents with invertebrate-specific ESVs using the maximum concentrations, except for perchlorate, beta-BHC, and di-n-butylphthalate (Table 4-6d). Using the 95% UCL soil concentration and invertebrate-specific ESVs, HQs exceed 1

for perchlorate and beta-BHC. Using the 95% UCL soil concentration and RSVs, HQs are below 1 except for perchlorate (HQ=20).

4.4.2.5 Parcel E

HQs exceed 1 using maximum soil concentrations and conservative ESVs for perchlorate and beta-BHC (Table 4-6e). Using the 95% UCL soil concentration and invertebrate-specific ESVs, HQs exceed 1 for beta-BHC but are equal to 1 for perchlorate. HQs are less than 1 for all constituents evaluated in Parcel E with invertebrate-specific RSVs using the maximum or 95% UCL soil concentrations (Table 4-6e).

4.4.2.6 Conclusions

While several constituents had HQs greater than 1, the results indicate that three constituents (perchlorate, manganese, and mercury) are the risk drivers for terrestrial invertebrates in the Operations Area.

Perchlorate, manganese, and mercury are ubiquitous throughout the OU-1 Refined SLERA Area (frequency of detections is 96%, 100%, and 85%, respectively). The 95% UCL RSV HQs for terrestrial invertebrates can be summarized as follows:

- The perchlorate HQ is 4 in Eco DU-1, 20 in Eco DU-3, and below the threshold of 1 elsewhere.
- The manganese HQ is 7 in Eco DU-1 and below the threshold of 1 elsewhere.
- The mercury HQ is 2 in Eco DU-1 and below 1 elsewhere.
- The DDE and DDx HQs are less than 1 in all areas.

Perchlorate may pose a risk to soil invertebrates in areas with the highest detected concentrations in Eco DU-1 and Eco DU-3. Figures 4-13 shows the perchlorate concentrations by sample location for each of the five spatial units compared to RSVs. As illustrated, perchlorate concentrations are below the plant and invertebrate RSVs in Parcel E and Eco DU-2 indicating that perchlorate in these spatial units do not likely pose an unacceptable risk to terrestrial plant and invertebrate receptors. Eco DU-1 has the greatest number of sampling locations with concentrations exceeding the RSVs, suggesting that the northern half of the Operations Area could potentially impact plants and invertebrates.

Manganese may also pose a risk to soil invertebrates in areas with the highest detected concentrations. Figure 4-14 shows the manganese concentrations by sample location for each Eco DU compared to two ecological risk values:

- The conservative Eco-SSL ESV for invertebrates, 450 mg/kg.
- The refined Eco-SSL RSV for invertebrates, 1,209 mg/kg.

As indicated, the majority of manganese detections fall below the RSV for soil invertebrates. However, some possible adverse impacts could occur for some invertebrate species in areas with the highest concentrations of manganese. Therefore, manganese is not identified as a chemical for future risk management consideration based on concerns for invertebrates in Eco DU-2, Eco DU-3, or Parcel E. However, manganese is identified for future risk management consideration based on concerns for plants for Eco DU-1.

Mercury may also pose a very slight risk to soil invertebrates in areas of Eco DU-1 with the highest detected concentrations. There are 20 samples from 1919 locations in Eco DU-1 where the soil concentration exceeds the invertebrate ESV (from USEPA Region 4 2018). Appendix G-2 shows the mercury concentrations by sample location for each Eco DU compared to ESVs. However, in a review of mercury sediment screening values prepared by Conder et al. (2015), the authors report that due to the complexity of mercury geochemistry there is a wide range of effect thresholds that are reported in the literature, many of which are overly conservative. The authors reported that mercury concentrations between 0.2 mg/kg and 1 mg/kg are a more accurate representation of toxicity to benthic invertebrates. Sediment and soil are similar matrices each with their own unique invertebrate community. However, as soil toxicity data are limited, the use of sediment toxicity testing results are informative. Applying the median concentrations between the two values provided by Conder et al. (2015) of 0.6 mg/kg yields a maximum HQ of 3 and a 95% UCL HQ of 0.2. Only two locations, both of which are in Eco DU-1, have concentrations greater than 0.6 mg/kg. Therefore, given the uncertainty in the existing invertebrate ESVs for mercury, and applying a conservative alternative RSV, it is reasonable to conclude that mercury is unlikely to pose a significant risk to invertebrates within the Operations Area. Therefore, mercury is not identified as a chemical identified for future consideration based on concerns for invertebrates. Some constituents lack invertebrate

ESVs, as identified on Tables 4-6a through 4-6e. These are discussed as an uncertainty in the uncertainty evaluation.

4.5 Risk Characterization for Birds, Mammals, and Reptiles via Food Web Pathways

Food web pathways were considered for COPECs identified in the OU-1 Refined SLERA as being potentially bioaccumulative. Tables 4-2a through 4-2e provide a list of COPECs for consideration in the food web model for each spatial unit, and indicates which chemicals are considered to be bioaccumulative based on USEPA 2000a and 2007a guidance documents. This section discusses the following elements of the evaluation of food web pathways:

- Wildlife Receptors (Section 4.5.1)
- Exposure Assessment for food web pathways (Section 4.5.2)
- Effects Assessment for the food web pathways (Section 4.5.3)

The following figures show concentrations by sample locations for each Eco DU, the ESVs and RSVs used for the plant and invertebrate specific evaluation, and results using the NOAEL and LOAEL TRVs for the food web modeling discussed further in this section:

- Figure 4-13: Perchlorate Concentrations by Area (Log Scale) – Refined Assessment
- Figure 4-14: Manganese Concentrations by Area (Log Scale) – Refined Assessment
- Figure 4-15: Dioxin/Furan TEQ Concentrations by Area (Log Scale) – Refined Assessment

4.5.1 Wildlife Receptors of Interest

Most healthy ecosystems support many individual species representing a variety of feeding guilds. However, it is not feasible to complete risk calculations for all potentially exposed species. Moreover, such an effort would be duplicative because of the similarity of exposure patterns among closely related species and among those with similar feeding guilds. For these reasons, surrogate receptors of interest are selected to represent the different feeding guilds. The following mammal and bird receptors were identified consistent with the receptors selected for the OU-1 Refined SLERA as follows in Exhibit 4-7:

Exhibit 4-7. Representative Wildlife Species Selected for Evaluation in the OU-1 Refined SLERA

Carnivore	Cooper's Hawk
	Kit Fox
	Western Burrowing Owl
Omnivore	Raccoon
Herbivore	Mourning Dove
	Great Basin Pocket Mouse
Insectivore	American Robin
	Fringed Myotis
	Desert Shrew

These species are both known to be susceptible to food web exposures or are representative prey of organisms that are susceptible to food web exposures (USEPA 1993). They reflect a range of trophic levels (e.g., carnivorous mammal as compared to an omnivorous mammal) and thus dietary exposure. Furthermore, dietary and toxicological information is available for these species, making them good candidate species for food web modeling (e.g., USEPA 1993, Sample et al. 1996). As such, the selected species can be used as surrogate species to represent the types of exposures and potential impacts that could occur to other wildlife species within OU-1. These animals are commonly found in southern Nevada.

4.5.2 Exposure Assessment for Food Web Pathways

As with plants and invertebrates, the food web evaluation considers two types of EPCs: the maximum (worst case) and a central tendency estimate, characterized by the 95% UCL when available (or the maximum when the UCL exceeded the maximum).

- Worst Case: This scenario uses maximum media concentrations to give upper-bound estimates of exposures within the OU-1 Refined SLERA Area because wildlife does not remain fixed around a single point in space.
- A Central Tendency Case (95% UCL): This scenario uses average media concentrations that more realistically estimate the types of exposures that are likely to occur as animals move around the OU-1 Refined SLERA Area and beyond. The UCL is the upper estimate of the AVG concentration. In instances where the 95% UCL exceeds the maximum concentration, the central tendency value used is the AVG concentration.

Based on the combination of exposures (maximum and central tendency) and the evaluation of five different spatial "units", the food web model presents 15 food web exposure scenarios for each representative bird and mammal as follows:

Exhibit 4-8. Three Exposure Scenarios Considered for Each Spatial Unit

Spatial Unit	Maximum EPC	Average EPC	UCL EPC
Operations Area	✓	✓	✓
Eco DU-1	✓	✓	✓
Eco DU-2	✓	✓	✓
Eco DU-3	✓	✓	✓
Parcel E	✓	✓	✓

Notes: Ecological Decision Unit (Eco DU); exposure point concentration (EPC); total daily intake (TDI); upper confidence limit of the mean (UCL)

4.5.2.1 Total Daily Dose

The exposure assessment yields estimates of total daily intake (TDI) of COPECs for the wildlife receptor of interest via diet and incidental ingestion of soil while foraging or preening/grooming. Incidental ingestion of water was not considered because there are no natural waterbodies within the OU-1 Refined SLERA Area and soil is the only media examined as described in the Work Plan. Total daily doses (TDDs) were calculated based on the methodology described in USEPA (1993). TDD is estimated as a function of an EPC, food ingestion rate, composition of diet, BW, and area use factor (AUF).

Dietary intakes are calculated for each upper trophic level receptor species using the following equation (USEPA 1993, ORNL 1994):

$$TDD = \frac{([IR_{FOOD} \times C_{FOOD}] + [IR_{SOIL} \times C_{SOIL}] + [IR_{WATER} \times C_{WATER}]) \times AUF \times AF}{BW}$$

Where:

TDD	=	Total daily dose (mg COPEC/kg wet weight [ww]-day)
IR_{FOOD}	=	Ingestion rate of food (kilograms per day [kg/day])
C_{FOOD}	=	Concentration of the COPEC in food (mg/kg)
IR_{SOIL}	=	Ingestion rate of soil (kg/day)
C_{SOIL}	=	Concentration of COPEC in soil (mg/kg)
IR_{WATER}	=	Ingestion rate of water (Liter [L]/day)
C_{WATER}	=	Concentration of COPEC in water (milligram per liter [mg/L])
AUF	=	Area use factor (unitless)
AF	=	Assimilation factor (unitless)
BW	=	Body weight (kg ww)

and:

$$C_{FOOD} = \sum((C_{FOOD1} + P_{FOOD1}) + (C_{FOOD2} + P_{FOOD2}) + (C_{FOOD\,i} + P_{FOOD\,i}))$$

C_{FOOD}	=	Concentration of COPEC in food (mg/kg)
C_{FOOD1}	=	C_{MEDIUM} x bioaccumulating factor (BAF) $_{FOOD1}$ (mg/kg)
P_{FOOD1}	=	Proportion of diet composed of food item 1 (unitless)
C_{FOOD2}	=	C_{MEDIUM} x BAF $_{FOOD2}$ (mg/kg)
P_{FOOD2}	=	Proportion of diet composed of food item 2 (unitless)
$C_{FOOD\,i}$	=	C_{MEDIUM} x BAF $_{FOOD\,i}$ (mg/kg)
$P_{FOOD\,i}$	=	Proportion of diet composed of the i^{th} food item (unitless)
BAF $_{FOOD1}$	=	Bioaccumulation factor for first food item (unitless)
BAF $_{FOOD2}$	=	Bioaccumulation factor for second food item (unitless)
BAF $_{FOOD\,i}$	=	Bioaccumulation factor for the i^{th} food item (unitless)

Consistent with the Work Plan, sediment and surface water are not considered in the food web model for the OU-1 Refined SLERA Area as sediment is not present and the only surface water present is the impounded ponds which are excluded from the ecological evaluation. Dietary dose is estimated by multiplying the amount of soil that is ingested by the chemical concentration in the soil. Dietary dose for food is obtained by summing the proportion of each dietary component multiplied by the concentration in each dietary component and multiplying that by the food ingestion rate. The concentration of chemicals in food and prey items (plants, invertebrates, and small mammals) are estimated using COPEC concentrations in OU-1 Refined SLERA Area soil and literature-derived

bioaccumulation factors (BAFs). If a receptor does not consume a given prey item, the fraction of the diet for that item is 0. Likewise, if a receptor does not consume a given medium, the amount of that medium consumed is 0. The food web model uptake approach for the dietary prey items (terrestrial plants, terrestrial invertebrates, and prey mammals) are presented in Appendix H-1.

Absorption factors and AUFs are also a component of the TDI. A conservative default value of 1 is used as the absorption factor (i.e., the fraction of chemical ingested that is absorbed into the system). This assumption likely overestimates the TDIs, as laboratory toxicity tests often use highly available forms of the test chemical, whereas actual bioavailability under natural conditions is considerably lower. AUFs are the estimation of dose to account for the possibility that some wildlife receptors may obtain some food from outside of the OU-1 Refined SLERA Area. An AUF is the ratio of the animals' home range and the area of the spatial unit being evaluated. AUF values of 1 and below 1 were used in the food web calculations based on specific species life history information.

The 15 EPC scenarios described in Section 4.5.2 are used to perform a series of calculations that represent 15 TDI estimates for each bird and mammal receptor as follows.

Exhibit 4-9. Three TDI Estimates in the Food Web Model for Each Bird and Mammal

Spatial Unit	Maximum EPC	Average EPC	UCL EPC
Operations Area	✓	✓	✓
Eco DU-1	✓	✓	✓
Eco DU-2	✓	✓	✓
Eco DU-3	✓	✓	✓
Parcel E	✓	✓	✓

Notes: Ecological Decision Unit (Eco DU); exposure point concentration (EPC); total daily intake (TDI); upper confidence limit of the mean (UCL)

4.5.2.2 Bioaccumulation and Bioconcentration Factors

The processes of bioaccumulation and bioconcentration are important to ERA because they provide a basis for prediction and discussion regarding the potential chemical uptake into flora and fauna. Chemicals in tissues of organisms of the food web are likely to be ingested by the species that feed on them (i.e., those occupying higher trophic levels), the result of which may be the expression of toxicological effects by the higher trophic level species. Bioaccumulation differs from bioconcentration on the basis of the mechanism of chemical uptake, although distinguishing between the two is sometimes highly artificial (Streit 1992). While chemicals with low bioaccumulation potential can pose a risk to wildlife at high enough soil concentrations via incidental ingestion of soil, the exposure does not occur through the food web. Therefore, only bioaccumulative chemicals were evaluated in the food web model. Wildlife HQs were calculated for bioaccumulative chemicals consistent with USEPA guidance (2000a and 2007a).

BAFs and bioconcentration factors (BCFs) used for the food web modeling were obtained from literature sources such as Sample et al. (1997), Baes et al. (1984), Travis and Arms (1988), Belfroid et al. (1994), Belfroid et al. (1995), Beyer (1990), Beyer et al. (1996), and other related literature are provided in Appendix H-1. The specific sources of BAFs and BCFs are provided in the notes section of each table presented in Appendix H-1.

4.5.2.3 Bioaccumulation and Bioconcentration Factors for TEQ

The USEPA's Eco SSL guidance document (USEPA 2007b) develops a mathematical approximation for uptake factors of non-ionic organic constituents from soil into earthworms based on a series of equations that consider the octanol-water partitioning coefficient (K_{ow}), the lipid fraction of the earthworms, the organic carbon content of the soil, and the soil organic carbon to water partitioning coefficient (K_{oc}). This means that the uptake of dioxins and furans (as well as other hydrophobic persistent organic pollutants) is governed by the balance between the organic carbon in the soil and the lipids of the receptor mediated by the amount of the constituent that can be dissolved in soil porewater.

The USEPA (2007b) states:

$$C_{worm} = K_{ww} \times C_w \quad \text{(Equation 1)}$$

Where:

- C_{worm} = concentration in worm (mg/kg ww)
- K_{ww} = biota to soil water partitioning coefficient (L soil pore water/kg ww tissue)
- C_w = Concentration in soil porewater (mg/L)

and K_{ww} is calculated from the following equation:

$$\text{Log}(K_{ww}) = 0.87 \times \text{Log}(K_{ow}) - 2 \quad \text{(Equation 2)}$$

The concentration of the constituent in soil pore water is calculated as:

$$C_w = C_s / K_d \quad \text{(Equation 3)}$$

Where:

- C_w = Concentration in soil porewater (mg/L)
- C_s = Concentration in soil (mg/kg soil)
- K_d = soil to water partitioning coefficient (L soil pore water/kg dry weight [dw] soil)

and:

$$K_d = f_{oc} \times K_{oc} \quad \text{(Equation 4)}$$

Where:

- f_{oc} = fraction of organic carbon in soil (kg organic carbon/kg soil)
- K_{oc} = soil organic carbon to water partitioning coefficient (L soil pore water/kg organic carbon)

Equations 1, 3, and 4 can be combined as:

$$C_{worm} = \frac{K_{ww} \times C_{soil}}{f_{oc} \times K_{oc}} \quad \text{(Equation 5)}$$

Equation 5 can be rearranged to isolate C_{soil} so that the latter half of the equation functions as a BAF.

$$C_{worm} = C_{soil} \times \left(\frac{K_{ww}}{f_{oc} \times K_{oc}}\right) \quad \text{(Equation 6)}$$

Equation 2 can then be rearranged to solve for K_{ww}:

$$K_{ww} = 10^{(0.87 \times \text{Log } (K_{ow})-2)} \quad \text{(Equation 7)}$$

The log (K_{ow}) for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD) is 6.8 (USEPA 2000b), with K_{ww} from Equation 7 can be calculated as follows:

$$K_{ww} = 10^{(0.87 \times 6.8 -2)}$$

$$K_{ww} = 8{,}242$$

The average OU-1 total organic carbon content is 0.23%, or a f_{oc} of 0.0023.

The K_{oc} for TCDD is 3.98×10^6 (USEPA 2000b).

Therefore, using Equation 4 and solving for K_d results in the following:

$$K_d = f_{oc} \times K_{oc}$$

$$K_d = 0.0023 \times (3.98 \times 10^6)$$

$$K_d = 9{,}154$$

Therefore, using Equation 6, and solving for C_{worm}:

$$C_{worm} = C_{soil} \times \left(\frac{K_{ww}}{f_{oc} \times K_{oc}}\right) \quad \text{(Equation 8)}$$

$$C_{worm} = C_{soil} \times \left(\frac{8{,}242}{9{,}154}\right)$$

$$C_{worm} = C_{soil} \times 0.90$$

The site-specific uptake factor for dioxin and furan TEQs (as TCDD) is 0.90 times the concentration in soil (C_{soil}), for wet weight (ww) earthworms. The BAF for earthworms for dioxin and furan TEQs (as TCDD) is 0.9 calculated using equations 1 to 8, as shown above and using the average organic carbon content of approximately 0.23%. The organic carbon within OU-1 soils ranges from 0.023% to 1.58%. BAFs derived using the average, and the 85th percentile to the 99th percentile of f_{oc} are summarized below and are discussed further in the uncertainty assessment, as indicated in Exhibit 4-10a:

Exhibit 4-10a. Range of Estimated TCDD BAFs Based on OU-1 Organic Carbon Measurements

	Average foc	85th Percentile foc	95th Percentile foc	99th Percentile foc	Maximum foc
foc	0.0023	0.00517	0.00856	0.011946	0.0158
BAFs	0.90	0.40	0.24	0.17	0.13

Notes: 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD); bioaccumulation factor (BAF); fraction organic carbon (foc); Operable Unit 1 (OU-1)

Literature studies were also considered as a basis of BAFs. Unlike many sites studied, OU-1 does not provide good habitat for earthworms, which are the most frequently used soil invertebrate uptake model for TEQs. Good habitat for earthworms includes soils that "remain moist and protected from extreme temperature changes" (Reynolds 2015). The soils within the OU-1 Refined SLERA Area are mostly sandy, dry, compacted, and provide little moisture and protection for earthworms (see photolog in Appendix B and description in Section 2.1.2). Particularly, the surface of the OU-1 Site is primarily Quaternary alluvial

deposits that slope north toward the Las Vegas Wash. The alluvium consists of a reddish-brown heterogeneous mixture of well-graded sand and gravel with lesser amounts of silt, clay, and caliche (Section 2.1.2). Caliche (or hardpan) is not the type of soil where earthworms can flourish. Uptake factors for earthworms therefore likely overestimate the likelihood of chemical exposures via the food web at OU-1.

Studies of TCDD/TEQ uptake factors for terrestrial insects were considered for the OU-1 Refined SLERA food web model and are described here, which have a variety of soil organisms and have a range of TCDD TEQ concentrations (Young et al. 1987 and Kay et al. 2005). Kay et al. (2005) surveyed soil and wildlife concentrations of TCDD near the Tittabawassee River in Michigan. They have co-located soil concentrations and invertebrate concentrations that allow for calculation of BCFs for a reference area and two study areas. The estimated BAFs for non-earthworm invertebrates from this study that range from 0.009 to 0.554 in areas with average soil concentrations of TCDD ranging from 2.04 parts per trillion (ppt) for the reference area and approximately 2,500 ppt for Locations 1 and 2 (i.e., 0.00000204 and 0.0025 mg/kg). Estimated BAFs using the data from Kay et al. (2005) showed that higher TCDD concentrations yielded lower BAFs.

A field study measured TCDD in soil and TCDD in insects in Florida (Young et al., 1987). Soil concentrations of TCDD were measured in three areas. The TCDD uptake factors calculated from this study range from 0.055 to 1.519, assuming a TCDD soil concentration of approximately 325 parts nanograms per kilogram (ng/kg, or 0.000325 mg/kg) as follows in Exhibit 4-10b:

Exhibit 4-10b. Calculation of a Weighted Average BAF for the OU-1 Refined SLERA Area

Study and Organism	Low End Estimate of BAF	High End Estimate of BAF
Young 1987 Crickets Minimum	0.055	0.115
Young 1987 Crickets Maximum	0.080	0.166
Young 1987 Soil/Plant Insects	0.123	0.255
Young 1987 Burrow Spiders	0.354	0.734
Young 1987 Beetle Grubs	0.732	1.519
Kay 2005 Non-Earthworm Invertebrates	0.009	0.554
Average of these BAFs	**0.39**	

Note: bioaccumulation factor (BAF); Operable Unit 1 (OU-1)

However, during the site reconnaissance, a trained ecologist noted that the actual distribution of invertebrates at the Site was roughly 45% crickets, 45% other insects, and 10% burrowing spiders, or other organisms like scorpions with a similar lifestyle, trophic level, and exposure patterns. A weighted average of the high-and-low end studies for these organisms results in a BAF of 0.19.

Exhibit 4-10c. Calculation of a Weighted Average BAF for the OU-1 Refined SLERA Area			
	BAF	**%**	**Contribution**
Crickets (average of 4 values)	0.104	45%	0.047
Soil/Plant Insects (average of 2 values)	0.189	45%	0.085
Burrowing Spiders (average of 2 values)	0.544	10%	0.054
Weighted Average BAF			**0.19**

Note: bioaccumulation factor (BAF); Operable Unit 1 (OU-1)

The TEQ concentrations for OU-1 soil vary for Eco DU-1, Eco DU-2, Eco DU-3, and Parcel E, with the lowest TEQ in Eco DU-2 and Parcel E and the highest TEQ in Eco DU-1, as summarized below.

Exhibit 4-10d. TEQs By Area				
TEQ (ng/kg, ppt)	**95% UCL TEQ by Area**			
	Eco DU-1	**Eco DU-2**	**Eco DU-3**	**Parcel E**
Dioxin/Furan Bird TEQ	1,870	63	1034	120
Dioxin/Furan Mammal TEQ	1,110	28	527.6	75.7

Notes: Ecological Decision Unit (Eco DU); nanograms per kilogram (ng/kg); parts per trillion (ppt); toxicity equivalent quotient (TEQ); upper confidence limit of the mean (UCL)

These concentrations are in the range of the Young et al. (1987) and the Kay et al. (2005) studies. Based on the available information, including the range of BAFs calculated using the USEPA Eco-SSL (2007b) formulae and OU-1 organic carbon data, the BAF used for OU-1 is the weighted average BAF of 0.19. The uncertainty associated with the BAF is discussed in the uncertainty assessment.

4.5.2.4 Exposure Parameters

Exposure parameters including incidental soil ingestion rates, food ingestion rates, prey preferences (percent dietary composition), BW, and foraging range for terrestrial wildlife species were generally obtained from the USEPA's Wildlife Exposure Factors Handbook (USEPA 1993) and ORNL's Estimating Exposure of Terrestrial Wildlife to Contaminants (ORNL 1994). Alternate sources were used if the standard sources did not provide sufficient information. The source information for any exposure parameter used is provided in the Table 4-7a. The literature was reviewed for exposure factors specific to local or southwestern species where available (ORNL 1994).

Food ingestion rates were based on the receptor's average BW identified in the literature. Food items evaluated in the food web model include plants, soil invertebrates, and small mammals.

Receptor-specific food ingestion rates were used for each of the receptors listed in Section 4.5.1. Guidance documents (USEPA 1993, Sample et al. 1997, United States Army Center for Health Promotion and Preventive Medicine [USACHPPM] 2004) did not have receptor-specific food ingestion rates for burrowing owl, fringed myotis, raccoon, and great basin

pocket mouse. For these receptors, food ingestion rates were calculated using an allometric equation for either birds or mammals, as described in USEPA (1993), and converted from dry weight (dw) to ww as needed using the moisture content of the dietary items which ranged from 10% to 75%. The exposure parameters or inputs for the receptor-specific dietary exposure models are identified by species in Appendix H-2 for each receptor. A summary of wildlife food web input variables and receptor parameters is provided in Table 4-7a.

The AUFs account for site-specific exposure frequency and are applied when the foraging area of a wildlife receptor is larger than the area being assessed. AUFs account for mobile wildlife receptors obtaining at least a portion of their food outside the OU-1 Refined SLERA Area. An AUF of 1 indicates that a wildlife receptor would obtain 100% of their diet from an area. An AUF of less than 1 (e.g., 0.4), assumes that a wildlife receptor would obtain 40% of their diet from an area. Although the OU-1 Refined SLERA Area encompasses a relatively large area and might include the foraging area of some wildlife receptors, there are many wildlife receptors with foraging ranges substantially larger than this Area. The specific AUFs used for a given representative receptor for each of the five subareas included in the OU-1 Refined SLERA are provided in Appendix H and summarized in Table 4-7a. For example, the AUF for the kit fox for the OU-1 Refined SLERA Area Operations Area is set at 0.094094. According to Sample et al. (1997) the home range of the kit fox is approximately 1,120 hectares based on radiotelemetry data. The Operations Area is 259 acres (105 hectares), so the AUF is approximately 0.094094. The basis of each AUF considered in this OU-1 Refined SLERA is described in Appendix H, as appropriate. Species such as mice, robins, and shrews do not have variable AUFs because their home ranges are small compared to the spatial scale of the area included in this OU-1 Refined SLERA.

4.5.2.5 Calculation of Potential Doses

Food web ingestion-based modeling calculations were performed to characterize potential exposures to contaminants via the food web and to identify potential adverse effects for birds and mammals.

Appendix I provides food web model calculations including calculations of daily dose, as follows:

- Table I-1: Operations Area
- Table I-2: Eco DU-1
- Table I-3: Eco DU-2
- Table I-4: Eco DU-3
- Table I-5: Parcel E

Understanding potential effects to populations requires some consideration of the spatial scale of effects. The portion of the OU-1 Refined SLERA Area where constituent exposures may reasonably occur was conservatively estimated. Where birds and mammals have large home ranges, their exposure to constituents is lower than that for birds and mammals with smaller home ranges.

Through food web modeling, COPECs will either be retained or eliminated from further steps of the refined SLERA. As stated above, the food-web modeling starts from an initial set of extremely conservative assumptions (maximum EPC, 100% bioavailability, AUF of 1) and is

used to identify chemicals that require further consideration. The food web model was refined to incorporate more realistic, site-specific assumptions to better understand both the conservative and realistic scenarios using refined exposure estimates.

4.5.3 Effects Assessment for Food Web Pathways

The effects assessment for wildlife is based on TRVs that relate ingested daily dose to ecotoxicological endpoints. TRVs for wildlife are literature-derived doses, below which adverse effects are unlikely. NOAEL TRVs are indicative of doses of constituents that have no deleterious effects on a given wildlife receptor. LOAEL TRVs are the minimum doses of constituents where deleterious effects are only just becoming apparent. Both NOAEL and LOAEL TRVs were used in this OU-1 Refined SLERA because the NOAEL TRVs represent the reasonable worst-case measure of effect and the LOAEL TRVs provide a realistic measure of effect. This approach provides a basis for understanding potential effects to individual birds and mammals. The results for birds and mammals can also be used to estimate potential risk to reptiles considering the lack of TRVs available in the literature specific to reptiles.

The following literature sources were reviewed for TRVs to be used in the OU-1 Refined SLERA.

- USEPA. 2007d. Guidance for Developing Eco-SSLs. Attachment 4-5 Eco-SSL Standard Operating Procedure (SOP) #6: Derivation of Wildlife Toxicity Reference Value. Office of Solid Waste and Emergency Response (OSWER) Directive 9285.7-55. Revised June.
- USEPA Region 6. 1999. SLERA Protocol for Hazardous Waste Combustion Facilities. Volume One (EPA530-D-99-001A). August.
- Sample, B. E., D.M. Opresko, G. W. Suter II. 1996. Toxicological Benchmarks for Wildlife: 1996 Revision. Oak Ridge National Laboratory, Oak Ridge, TN. June 1996. ES/ER/TM-86/R3.
- USACHPPM. 2007. Wildlife Toxicity Assessment for Perchlorate (USACHPPM Document No. 87-MA02T6-05D). February.

The TRVs used in the food web model are provided in Table 4-7b and 4-7c. TRVs for dioxins and furans that are identified in Table 4-7b are based on bird and mammal TEQs, as described for birds and mammals below.

4.5.3.1 Bird Dioxin/Furan TEQ TRVs

The dietary TRVs used for the food web modeling for birds in this refined SLERA were derived from the Nosek et al. (1992a) pheasant study, as shown in Table 4-7b. These NOAEL and LOAEL TRVs are considered appropriately protective for use in this OU-1 Refined SLERA because there is a scientific basis and a regulatory precedent for use of this study by USEPA. The scientific basis and USEPA precedents are described as follows: Nosek et al. (1992a, 1992b, 1993) conducted several comprehensive toxicity studies of TCDD in the ring-necked pheasant. Nosek et al. (1992a, 1992b, 1993) measured egg production and hatchability following weekly exposure of hens via injection of TCDD into the abdominal cavity, at three concentrations for 10 weeks that included reproduction. Hens were dosed once per week for 10 weeks, with 10, 100, and 1,000 ng TCDD per kg adult BW kg adult body (wt^{-1}) per week (wk^{-1}). During weeks 9 and 10, the hens were bred to unexposed roosters. Eggs were collected from each hen and reared through hatching. All hens receiving 10 doses of 1,000 ng TCDD/kg adult body $wt^{-1} \cdot wk^{-1}$ (a cumulative dose of 10,000

ng/kg adult body wt^{-1}) died by the end of 24 weeks. BW and egg production in the high dose group declined, whereas BW and egg production increased in the other treatment groups. Embryo mortality was 100% in the eggs produced by hens in the high dose group and generally occurred within 72 hours of laying. Embryo mortality appeared to increase in a dose-dependent manner but was only significantly different from controls in the high dose group. The subacute NOAEL and LOAEL derived from this study were 100 and 1,000 ng TCDD·kg adult body wt^{-1}·wk^{-1}. Based on daily dietary exposure, the NOAEL and LOAEL are 14 and 140 ng TCDD·kg adult body wt^{-1} per day (d^{-1}) based on adult mortality, egg production, and embryo mortality.

The results of the same Nosek et al. (1992a) study have been used to develop TRVs in other studies, and they are therefore considered applicable for the OU-1 Refined SLERA. For example, Sample et al. (1996) used the NOAEL and LOAEL TRVs reported in Nosek et al. (1992a) as the basis for developing TCDD TRVs for numerous avian wildlife receptors. Sample et al. (1996) did not apply any uncertainty factors to the values reported by Nosek et al. (1992a) due to the sensitivity of measured endpoints, and uncertainty factors are therefore not applied in this OU-1 Refined SLERA. In addition, an interspecies uncertainty factor is not necessary because the pheasant is equally sensitive or more sensitive to TCDD induced effects than other avian species studied (e.g., Cohen-Barnhouse et al. 2011). The endpoints, egg laying, and egg hatchability measured in Nosek et al. (1992a) are of ecological relevance and likely the most sensitive endpoints for avian species; therefore, there is no endpoint extrapolation uncertainty factor.

USEPA (1995) selected the values reported in Nosek et al. (1992a) to develop a chronic water quality value for avian wildlife exposed to TCDD. USEPA (2001, 2000b) used the Nosek et al. (1992a) pheasant study to develop dietary exposure TRVs for the kingfisher, great blue heron, mallard, and bald eagle. Uncertainty factors used in that assessment were the same as those described above for USEPA (1995), with final chronic NOAEL and LOAEL TRVs of 1.4 and 14 ng TCDD·kg adult body wt^{-1}·d^{-1}, respectively.

4.5.3.2 Mammal Dioxin/Furan TEQ TRVs

The protective mammalian TRVs for this OU-1 Refined SLERA are based on the scientific literature: Murray et al. 1979; Moore et al. 2011; and Zwiernik et al. 2009. Specifically, the Murray et al. (1979) rat study was used for the evaluation of exposures and risks for the pocket mouse in this OU-1 Refined SLERA, shown in Table 4-7b. TRVs derived from studies on sensitive species, such as mink, were considered conservative and protective for the evaluation in this OU-1 Refined SLERA. While mink are not present in the OU-1 Refined SLERA Area due to the lack of available aquatic habitat, mink have been observed to be among the most sensitive mammalian species for which information on the effects of dioxins, furans, and related compounds is available. Therefore, use of mink TRVs for the desert shrew, raccoon, kit fox, and fringed myotis is considered a conservative evaluation of potential risks for these receptors. The studies considered for the OU-1 Refined SLERA TRVs are briefly described as follows:

- Murray et al. (1979) conducted a three-generation reproduction study in which Sprague-Dawley rats were exposed by diet to three doses of TCDD plus a control (0, 1, 10, and 100 ng·kg body wt^{-1}·d^{-1}) through a reproductive life stage. No adverse effects were observed at a dose level of 1 ng TCDD·kg body wt^{-1}·d^{-1}. At 10 ng TCDD·kg body wt^{-1}·d^{-1}, adverse effects were observed including a decrease in fertility, litter size, gestation survival, postnatal survival, and postnatal BW. This was

a multi-generational study that considered dietary exposure during reproduction, and the effect levels are lower than reproductive effect levels reported for other mammals. Hence, the 1 and 10 ng TCDD·kg body $wt^{-1}·d^{-1}$ doses were considered to be chronic NOAELs and LOAELs that are appropriately conservative for the range of sensitivity for mammals in terrestrial habitats.

- Blankenship (2008) identified dietary TRVs for mink exposed to TEQ that ranged from 12.1 to 56.6 ng TEQ·kg feed(ww)$^{-1}$ for the NOAEL and from 50.4 to 242 ng TEQ·kg feed(ww)$^{-1}$ for the LOAEL. The corresponding BW normalized doses for the high end of each of these ranges are 7.2 ng TEQ kg body wt^{-1} d^{-1} for NOAEL (Bursian et al. 2006a, b) and 31 ng TEQ kg body wt^{-1} d^{-1} for LOAEL (Zwiernik et al. 2009).
- The more recent and relevant laboratory feeding study conducted by Moore et al. (2011) evaluated reproductive and developmental effects of 2,3,7,8-TCDD, 2,3,7,8-tetrachlorodibenzofuran (TCDF) and 2,3,4,7,8-pentachlorosibenzo-p-furan (PeCDF). The design of the feeding study followed the WHO's recommendations for exposure studies investigating the relative potency of dioxin-like compounds (Van den Berg et al. 1998; Van den Berg et al. 2006). Mink exposure occurred over an entire reproductive cycle as part of the daily diet for 117 female mink and their offspring. The study included four doses each for three treatments: two individual furan congener treatments (TCDF and PeCDF) and a single dioxin treatment (TCDD). The lower doses bracketed environmentally relevant concentrations, while the highest dose-level for each congener (TCDD=8.4 ng, PeCDF=15 ng, and TCDF=25 ng TEQ/kg body $wt^{-1}·d^{-1}$) was significantly greater than median predicted environmental exposures for dioxin-contaminated sites. Based on TEF-normalized PCB and PCB mixture feeding studies, this was expected to elicit complete reproductive failure. Measurement endpoints included adult survival, adult breeding success, whelping success, kit survival, nutritional status, feed consumption, gross morphology attributes including organ masses and physical abnormalities, induction and activity of cytochrome P450 xenobiotic metabolizing enzymes (enzyme induction, protein concentrations, and gene expression related to cytochrome P450), liver and jaw histology, and kit health measurements including birth mass, survival, and growth. TCDD, PeCDF, or TCDF at the greatest doses employed did not result in complete reproductive failure. In fact, the greatest dose did not elicit a statistically significant response for any of the measurement endpoints associated with reproduction or survival. Therefore, congener-specific NOAELs derived from the Moore et al. (2011) study are applied as NOAELs in this OU-1 Refined SLERA (8.4 ng TCDD TEQ, 15 PeCDF ng TEQ, and 25 TCDF ng TEQ kg body $wt^{-1}·d^{-1}$). The LOAEL of 31 ng TEQ kg body $wt^{-1}·d^{-1}$ from Zwiernik et al. (2009) is also applied but considered conservative due to the presence of co-contaminants.
- There is a wide range of species sensitivities to PCDDs, PCDFs, and other AhR-active chemicals (Gasiewicz et al. 1991). Thus, the less related the test species is compared to the receptor of concern, the more uncertainty is associated with the TRV. Very few studies have evaluated ecologically relevant endpoints after chronic exposure of dioxins and furans to mammals. Given that limitation, studies that included ecologically relevant endpoints such as effects on reproductive and developmental toxicity as well as reduced survival were relied upon whenever possible.

4.6 Refined Risk Calculations for Food Web Pathways

Predictions of the likelihood for adverse effects, if any, for the food web modeling studies was based on HQs (USEPA 1997):

$$HQ = \frac{TDD}{TRV}$$

Where:

TDD = Total daily dose

TRV = NOAEL and LOAEL TRVs

The food web model for the OU-1 Refined SLERA presents a matrix of risk assessment results (i.e., HQs) in terms of the NOAEL HQs and LOAEL HQs for each of the bird and mammal wildlife receptors as follows in Exhibit 4-11:

Exhibit 4-11. Food Web Model Risk Estimates (HQs) for Birds and Mammals Are Calculated for the Following Exposure Scenarios

Birds and Mammals	NOAEL			LOAEL		
	Maximum	Average	UCL	Maximum	Average	UCL
Cooper's Hawk	✓	✓	✓	✓	✓	✓
Kit Fox	✓	✓	✓	✓	✓	✓
Burrowing Owl	✓	✓	✓	✓	✓	✓
Desert Shrew	✓	✓	✓	✓	✓	✓
Fringed Myotis Bat	✓	✓	✓	✓	✓	✓
Raccoon	✓	✓	✓	✓	✓	✓
Mourning Dove	✓	✓	✓	✓	✓	✓
Great Basin Pocket Mouse	✓	✓	✓	✓	✓	✓

Notes:
✓ Reflects the most conservative of any risk estimate (or HQ), likely not realistic because wildlife is not continuously exposed to maximum concentrations.
✓ Reflects varying degrees of conservative risk estimates depending on the EPC (maximum or central tendency), the dataset used (all data or the refined dataset excluding data points from soils under asphalt and pavement), and the toxicity reference value (reflecting "no observable adverse effect" or the "lowest observable adverse effect").
✓ Reflects the risk estimates (i.e., HQs) that are the most informative as to whether or not potential "lowest observable adverse effects" are likely to be observed for one or more of all of the birds and mammals evaluated.
*Exposure point concentration (EPC); hazard quotient (HQ); lowest observed adverse effect level (LOAEL); n*o observed adverse effect level *(NOAEL); upper confidence level of the mean (UCL)*

The ecological significance of risk must consider the available information, such as wildlife use of the environment, the spatial extent of the release, the persistence of the release (i.e., the temporal scale), and natural variability within the system (and whether impacts can be measured separate from natural variability). The spatial scale of the risk is considered relative to the extent of the actual wildlife populations, the number of organisms within the population that may be impacted, the correlation between stressor and response as indicated by the TRV, the scientific basis for judging environmental harm, the receptor

specificity of available data and how that relates to a study area, and the representativeness of exposure and effects data sets (spatial, temporal, and quantitative) (Barnthouse et al. 2008, USEPA 1997, USEPA 1994, Menzie et al. 1996).

4.6.1 Risk Characterization for the Food Web Pathways

The risk characterization for the food web pathways involves the integration of the exposure assessment and effects assessment to evaluate the likelihood, severity, and spatial distribution of predicted or observed effects. For the food web pathways, this is an HQ that compares the TDI and TRV, where an HQ that is less than or equal to a threshold value of 1 indicates that adverse impacts to bird and mammal populations via the food web is unlikely.

The food web model HQs for each of the representative species identified in Section 4.5.1 is provided in Appendix I, Tables I-1 through I-5, for each of the five spatial units.

The information provided in Appendix I is summarized into a series of tables that provide the wildlife food web model HQ for each of the birds and mammals, as follows:

- Food web model maximum HQ summaries are provided on Tables 4-8a to 4-8e for each of the five spatial units included in this OU-1 Refined SLERA.
- Food web model AVG and UCL HQ summaries are provided on Tables 4-9a through 4-9e for each of the five spatial units.
- Food web model UCL HQ summaries are provided on Tables 4-10a through 4-10e for each of the five spatial units.

4.6.2 Food Web Risk Characterization Results

The wildlife food web model HQ summaries for each of the birds and mammals are shown on Tables 4-8a through 4-10e, as follows:

- Maximum HQ Summaries using NOAEL and LOAEL TRVs
- AVG and 95% UCL HQ Summaries using NOAEL and LOAEL TRVs
- UCL HQ Summaries using LOAEL TRVs

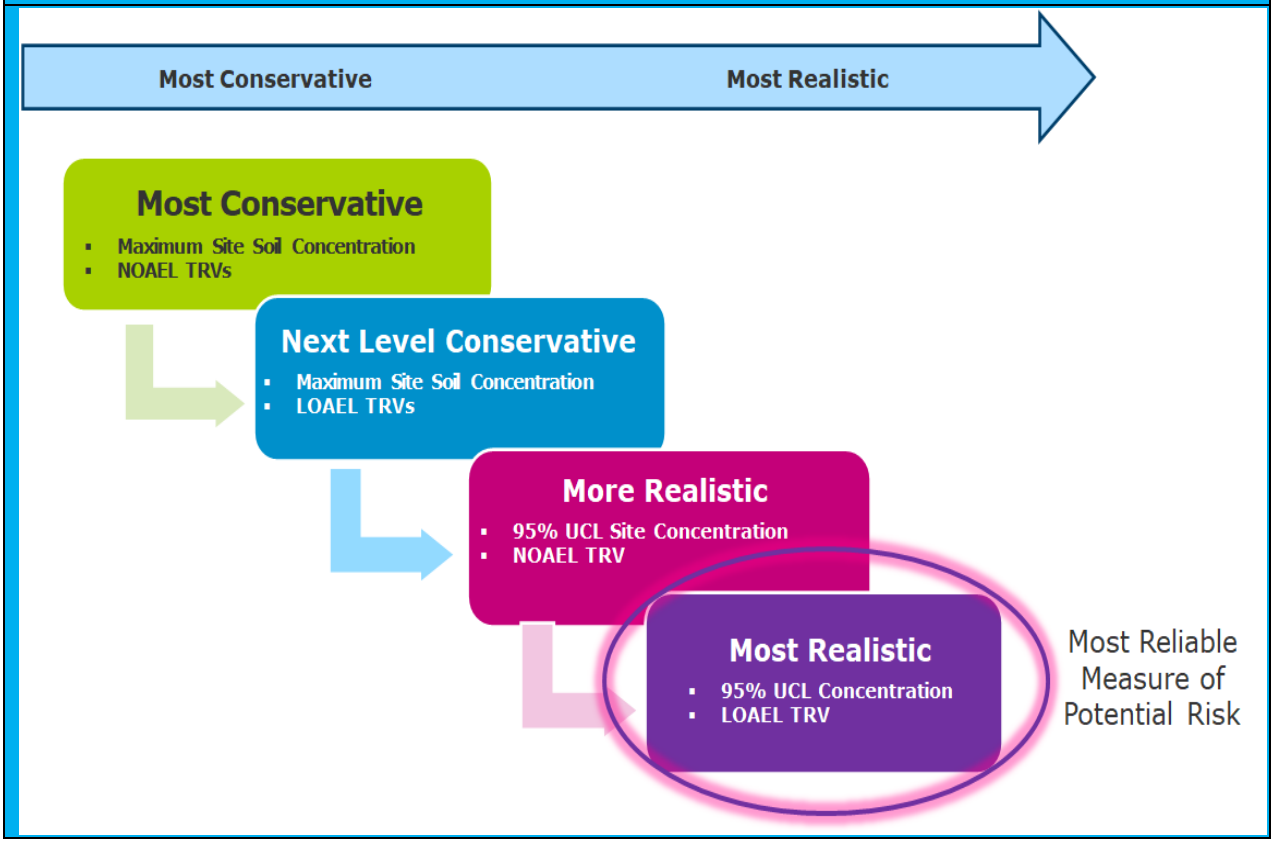
Each of the above are provided for each of the five spatial units:

- Operations Area Food Web Model HQ Summaries (Tables 4-8a, 4-9a, 4-10a)
- Eco DU-1 Food Web Model HQ Summaries (Tables 4-8b, 4-9b, 4-10b)
- Eco DU-2 Food Web Model HQ Summaries (Tables 4-8c, 4-9c, 4-10c)
- Eco DU-3 Food Web Model HQ Summaries (Tables 4-8d, 4-9d, 4-10d)
- Parcel E Food Web Model HQ Summaries (Tables 4-8e, 4-9e, 4-10e)

A summary of UCL and LOAEL HQs for all receptors and all areas is provided in Table 4-10f (i.e., this table provides the summary of UCL LOAEL HQ information from Tables 4-10a through 4-10e for the Operations Area, Eco DU-1, Eco DU-2, Eco DU-3, and Parcel E). This table with all receptors and areas of focus allows a rapid comparison and understanding of the chemicals, receptors, and areas with the greatest risk potential.

The refined SLERA is conducted in a stepwise fashion starting with the most conservative input values and proceeding to a realistic evaluation of potential risk as follows:

Exhibit 4-12. Stepwise Evaluation Used in Refined SLERA



Notes: lowest observed adverse effect level (LOAEL); no observed adverse effect level (NOAEL); toxicity reference value (TRV); upper confidence level (UCL) of the mean.

Each of these steps are summarized as follows:

- **Most Conservative:** This is the first step in the evaluation of potential risk where the most conservative values are used to calculate HQs using the maximum soil concentrations (maximum EPCs) within the OU-1 Refined SLERA Area compared to highly conservative NOAEL TRVs. The most conservative step also assumes that wildlife spends 100% of their time within the OU-1 Refined SLERA Area which is indicated by an AUF set to 1.
- **Next Level Conservative:** This is the next level of conservative evaluation of potential risk where HQs are calculated using the maximum soil concentrations compared to LOAEL TRVs. The results are presented considering AUFs equal to 1 and species-specific AUFs (AUFs less than or equal to 1 depending on the species).
- **More Realistic:** This third level of evaluation represents a more realistic evaluation of potential risks to wildlife within the OU-1 Refined SLERA Area where HQs are calculated using the 95% UCL soil concentrations (95% UCL EPCs) compared to NOAEL TRVs and AUFs equal to 1.

- **Most Realistic:** The final level of evaluation reports HQs using the most realistic values contained in the food web model. This includes the 95% UCL soil concentrations compared to LOAEL TRVs and species-specific AUFs.

Note that HQ calculations are provided for each species with an AUF of 1 (meaning the bird or mammal spends 100% of the lifetime within the OU-1 Refined SLERA Area) as noted in the tables and appendices referenced. For the summary of chemicals with HQs exceeding 1 discussed in the risk characterization and risk summary, the HQs reflect the more realistic AUFs for larger home range species (i.e., Cooper's hawk, kit fox, burrowing owl, fringed myotis, raccoon, and mourning dove).

4.6.2.1 Risk Characterization for Birds and Mammals: Operations Area

Most Conservative: Operations Area HQs using Maximum EPCs, NOAEL TRVs, and AUFs equal to 1.

The food web model results for the Operations Area using the most conservative input values are provided in Table 4-8a (MAX/NOAEL column). A summary of the results indicate that the maximum EPC/NOAEL HQs exceed the threshold value of 1 for at least one receptor for 14 of the 16 chemicals included in the food web model. HQs for mercury and octachlorostyrene were below 1 for each species evaluated.

Next Level Conservative: Operations Area HQs using Maximum EPCs, LOAEL TRVs, with and without species specific AUFs.

The food web model results for the Operations Area using the next level conservative input values are provided in Table 4-8a (MAX/LOAEL column). A summary of the results indicate that the maximum EPC/LOAEL HQs exceed the threshold value of 1 for 77 of the 166 chemicals included in the food web model. HQs for antimony, boron, mercury, vanadium, 4,4'-DDT, beta-BHC, total PCBs, PCB TEQs (mammal and avian), and octachlorostyrene were less than or equal to 1 for each species evaluated.

Chemicals with LOAEL HQs exceeding the threshold value of 1 include perchlorate, dioxins/furans TEQs (mammal and avian), lead, manganese, 4,4'-DDE, DDx, and hexachlorobenzene (HCB). These results apply regardless of whether the species-specific AUF or the AUF of 1 is used.

More Realistic: Operations Area HQs are calculated using the 95% UCL EPCs, NOAEL TRVs, and AUFs equal to 1.

The food web model results for the Operations Area using more realistic input values are provided in Table 4-9a (UCL/NOAEL column). A summary of the results indicate that the 95% UCL/NOAEL HQs exceed the threshold value of 1 for 66 of the 16 chemicals included in the food web model.

Chemicals with 95% UCL/NOAEL HQs exceeding the threshold value of 1 include:

- American robin, desert shrew, and fringed myotis exposed to perchlorate (HQs ranging from 4 to 6).
- American robin, burrowing owl, desert shrew, fringed myotis, and raccoon exposed to dioxins/furans (HQs ranging from 2 to 10).
- Desert shrew and pocket mouse exposed to manganese (HQs of 4 and 2, respectively).

- Cooper's hawk, kit fox, burrowing owl, desert shrew, and fringed myotis exposed to 4,4'-DDE (HQs ranging from 2 to 10).
- Desert shrew and fringed myotis exposed to DDx (HQs=2.)
- American robin exposed to HCB (HQ=4).

Most Realistic: Operations Area HQs are calculated using the 95% UCL EPCs, LOAEL TRVs, with and without species-specific AUFs.

The food web model results for the Operations Area using the most realistic input values are provided in Table 4-10a (UCL/LOAEL column) and summarized below for the receptors where HQs exceed the threshold value of 1. A summary of the results indicate that the 95% UCL/LOAEL HQs exceed the threshold value of 1 for 3 of the 168 chemicals included in the food web model using an AUF=1, as indicated in Exhibit 4-13 below. HQs were less than or equal to 1 for 133 chemicals. Using AUFs=1, HQs exceed 1 for the American robin exposed to perchlorate (HQ=2); for the desert shrew and fringed myotis exposed to dioxins/furans (HQs=4); and for the kit fox exposed to 4,4'-DDE (HQ=2). However, taking into consideration the species-specific AUFs, the HQs for the kit fox exposed to 4,4'-DDE and the fringed myotis exposed to dioxins/furans are below the threshold value of 1. As such, potential risks to the kit fox and fringed myotis are unlikely but risks to the desert shrew from exposure to dioxins/furans and to the American robin from exposure to perchlorate cannot be ruled out.

Exhibit 4-13. Food Web Model HQs for Operations Area

Chemical	Operations Area - Most Realistic Scenario HQ greater than 1	
	UCL/LOAEL/species-specific AUF HQs	
	Desert Shrew	American Robin
Perchlorate	1	2
Dioxins/Furans	4	1

Notes:
Area Use Factor (AUF); upper confidence limit of the mean (UCL); lowest observed adverse effect level (LOAEL); hazard quotient (HQ).

The HQ is between 2 and 10

4.6.2.2 Risk Characterization for Birds and Mammals: Eco DU-1

Most Conservative: Eco DU-1 HQs using Maximum EPCs, NOAEL TRVs, and AUFs equal to 1.

The food web model results for Eco DU-1 using the most conservative input values are provided in Table 4-8b (MAX/NOAEL column). A summary of the results indicate that the maximum EPC/NOAEL HQs exceed the threshold value of 1 for 144 of the 166 chemicals included in the food web model. HQs for mercury and octachlorostyrene were below 1 for each species evaluated.

Next Level Conservative: Eco DU-1 HQs using Maximum EPCs, LOAEL TRVs, with and without species specific AUFs.

The food web model results for Eco DU-1 using the next level conservative input values are provided in Table 4-8b (MAX/LOAEL column). A summary of the results indicate that the maximum EPC/LOAEL HQs exceed the threshold value of 1 for 7 of the 166 chemicals included in the food web model. HQs for antimony, boron, mercury, vanadium, 4,4'-DDT, beta-BHC, total PCBs, PCB TEQs (mammal and avian), and octachlorostyrene were less than or equal to 1 for each species evaluated.

Chemicals with LOAEL HQs exceeding the threshold value of 1 include perchlorate, dioxin/furan TEQs (mammal and avian), lead, manganese, 4,4'-DDE, DDx, and HCB. These results apply regardless of whether the species-specific AUF or the AUF of 1 is used.

More Realistic: Eco DU-1 HQs are calculated using the 95% UCL EPCs, NOAEL TRVs, and AUFs equal to 1.

The food web model results for Eco DU-1 using more realistic input values are provided in Table 4-9b (UCL/NOAEL column). A summary of the results indicate that the 95% UCL/NOAEL HQs exceed the threshold value of 1 for 66 of the 166 chemicals included in the food web model.

Chemicals with 95% UCL/NOAEL HQs exceeding the threshold value of 1 include:

- American robin, desert shrew, and fringed myotis exposed to perchlorate (HQs ranging from 4 to 6).
- American robin, burrowing owl, desert shrew, fringed myotis, and raccoon exposed to dioxins/furans (HQs ranging from 3 to 20).
- Desert shrew and pocket mouse exposed to manganese (HQs of 4 and 2, respectively).
- Cooper's hawk, kit fox, burrowing owl, desert shrew, and fringed myotis exposed to 4,4'-DDE (HQs ranging from 2 to 10).
- Desert shrew and fringed myotis exposed to DDx (HQs=2).
- American robin and burrowing owl exposed to HCB (HQs of 4 and 2, respectively).

Most Realistic: Eco DU-1 HQs are calculated using the 95% UCL EPCs and LOAEL TRVs, with and without species-specific AUFs.

The food web model results for Eco DU-1 using the most realistic input values are provided in Table 4-10b (UCL/LOAEL column) and summarized below for the receptors where HQs exceed the threshold value of 1. A summary of the results indicate that the 95% UCL/LOAEL HQs exceed the threshold value of 1 for 3 of the 16 chemicals included in the

food web model using an AUF=1. HQs were less than or equal to 1 for 13 of the 16 chemicals. HQs exceed 1 for the American robin exposed to perchlorate (HQ=2); the desert shrew (HQ=5); the fringed myotis (HQ=5); the American robin (HQ=2) exposed to dioxins/furans; and for the kit fox exposed to 4,4'-DDE (HQ=2), as indicated in Exhibit 4-14a below. However, taking into consideration the species-specific AUFs, the HQs for the kit fox exposed to 4,4'-DDE and the fringed myotis exposed to dioxins/furans are below the threshold value of 1. As such, and similar to the results for the Operations Area, the potential risks to the desert shrew from exposure to dioxins/furans and to the American robin from exposure to perchlorate cannot be ruled out; however, there is also potential risk to American robin from exposure to dioxins/furans (HQ=2) in Eco DU-2, whereas in the Operations Area the perchlorate HQ was equal to 1.

Exhibit 4-14a. Food Web Model Results Eco DU-1

Chemical	Eco DU-1 - Most Realistic Scenario HQ Greater than 1	
	UCL/LOAEL/species-specific AUF HQs	
	Desert Shrew	American Robin
Perchlorate	1	2
Dioxins/Furans	5	2

Notes:
Area Use Factor (AUF); ecological decision unit (Eco DU); upper confidence limit of the mean (UCL); lowest observed adverse effect level (LOAEL); hazard quotient (HQ).

The HQ is between 2 and 10.

4.6.2.3 Risk Characterization for Birds and Mammals: Eco DU-2

This section provides a summary of the results from the food web modeling for Eco DU-2.

Most Conservative: Eco DU-2 HQs using Maximum EPCs, NOAEL TRVs, and AUFs equal to 1.

The food web model results for Eco DU-2 using the most conservative input values are provided in Table 4-8c (MAX/NOAEL column). A summary of the results indicate that the maximum EPC/NOAEL HQs exceed the threshold value of 1 for 66 of the 100 chemicals included in the food web model for Eco DU-2. HQs for perchlorate, boron, cadmium, and beta-BHC were equal to or below the threshold value of 1.

Next Level Conservative: Eco DU-2 HQs using Maximum EPCs and LOAEL TRVs, with and without species specific AUFs.

The food web model results for Eco DU-2 using the next level conservative input values are provided in Table 4-8c (MAX/LOAEL column). A summary of the results indicates that the maximum EPC/LOAEL HQs using AUFs=1 exceed the threshold value of 1 for 2 of the 100 chemicals included in the food web model. HQs for 4,4'-DDE exceeds the threshold value of 1 for four of the species evaluated (Cooper's hawk, kit fox, desert shrew, and fringed myotis), and the HQ for DDx exceeds the threshold value of 1 for three species evaluated (kit fox, desert shrew, and fringed myotis). However, when taking the species-specific AUFs into account, the HQs for the Cooper hawk, kit fox, fringed myotis exposed to 4,4'-DDE, and kit fox and fringed myotis exposed to DDx are below the threshold value of 1. Potential risks to the desert shrew from exposure to 4,4'-DDE and DDx (HQs=3) cannot be ruled out.

More Realistic: Eco DU2 HQs are calculated using the 95% UCL EPCs, NOAEL TRVs, and AUFs equal to 1.

The food web model results for Eco DU-2 using more realistic input values are provided in Table 4-9c (UCL/NOAEL column). A summary of the results indicate that the 95% UCL/NOAEL HQs exceed the threshold value of 1 for 3 of the 100 chemicals included in the food web model. Chemicals with 95% UCL/NOAEL HQs exceeding the threshold value of 1 include:

- Desert shrew and fringed myotis exposed to antimony (HQs of 2).
- Cooper's hawk, kit fox, burrowing owl, desert shrew, and fringed myotis exposed to 4,4'-DDE (HQs ranging from 3 to 10).
- Cooper's hawk, kit fox, burrowing owl, American robin, desert shrew, and fringed myotis exposed to DDx (HQs ranging from 2 to 3).

Most Realistic: Eco DU-2 HQs are calculated using the 95% UCL EPCs and LOAEL TRVs, with and without species-specific AUFs.

The food web model results for Eco DU-2 using the most realistic input values are provided in Table 4-10c (UCL/LOAEL column). A summary of the results indicate that the 95% UCL/LOAEL HQs exceed the threshold value of 1 for 1 of the 100 chemicals included in the food web model using an AUF=1. HQs exceed 1 for the kit fox exposed to 4,4'-DDE (HQ=2). However, taking into consideration the species-specific AUF, the HQ for the kit fox exposed to 4,4'-DDE is below the threshold value of 1. As such, potential risks of ecological receptors within Eco DU-2 are *de minimis* as all 95% UCL/LOAEL HQs using species specific AUFs are below the threshold value of 1.

4.6.2.4 Risk Characterization for Birds and Mammals: Eco DU-3

This section provides a summary of the results from the food web modeling for Eco DU-3.

Most Conservative: Eco DU-3 HQs using Maximum EPCs, NOAEL TRVs, and AUFs equal to 1.

The food web model results for Eco DU-3 using the most conservative input values are provided in Table 4-8d (MAX/NOAEL column). A summary of the results indicate that the maximum EPC/NOAEL HQs exceed the threshold value of 1 for 44 of the 88 chemicals included in the food web model for Eco DU-2. HQs for 4,4'-DDT, DDx, beta-BHC, and octachlorostyrene were equal to or below the threshold value of 1. HQs for perchlorate, dioxins/furans TEQs (birds and mammals), 4,4'-DDE, and HCB exceeded the value of 1.

Next Level Conservative: Eco DU-3 HQs using Maximum EPCs and LOAEL TRVs, with and without species specific AUFs.

The food web model results for Eco DU-3 using the next level conservative input values are provided in Table 4-8d (MAX/LOAEL column). A summary of the results indicate that the maximum EPC/LOAEL HQs exceed the threshold value of 1 for 22 of the 88 chemicals included in the food web model. HQs for perchlorate exceed the threshold value of 1 for 6 of the species evaluated and dioxins/furans exceed the threshold value of 1 for 3 of the species evaluated. When taking the species-specific AUFs into account, only perchlorate and dioxin/furan HQs exceed 1 for the American robin and desert shrew.

More Realistic: Eco DU-3 HQs are calculated using the 95% UCL EPCs, NOAEL TRVs, and AUFs equal to 1.

The food web model results for Eco DU-3 using more realistic input values are provided in Table 4-9d (UCL/NOAEL column). A summary of the results indicate that the 95% UCL/NOAEL HQs exceed the threshold value of 1 for 44 of the 88 chemicals included in the food web model.

Chemicals with 95% UCL/NOAEL HQs exceeding the threshold value of 1 include:

- Kit fox, burrowing owl, American robin, desert shrew, fringed myotis, raccoon, and pocket mouse exposed to perchlorate (HQs ranging from 2 to 20).
- American robin, burrowing owl, desert shrew, and fringed myotis exposed to dioxins/furans (HQs ranging from 3 to 9).
- Cooper's hawk, kit fox, burrowing owl, and desert shrew exposed to 4,4'-DDE (HQs ranging from 2 to 5).
- American robin exposed to HCB (HQ=4).

Most Realistic: Eco DU-3 HQs are calculated using the 95% UCL EPCs, LOAEL TRVs, with and without species-specific AUFs.

The food web model results for Eco DU-3 using the most realistic input values are provided in Table 4-10d (UCL/LOAEL column) and summarized below for the receptors where HQs exceed the threshold value of 1. A summary of the results indicate that the 95% UCL/LOAEL HQs exceed the threshold value of 1 for 2 of the 8 chemicals included in the food web model. HQs exceed 1 for the burrowing owl, American robin, desert shrew, and fringed myotis exposed to perchlorate (HQs ranging from 2 to 7) and desert shrew and fringed myotis exposed to dioxins/furans (HQ=2), as indicated in Exhibit 4-14b below. However, taking into consideration the species-specific AUFs, the HQs for the fringed myotis exposed to perchlorate and dioxins/furans and the HQs for the burrowing owl exposed to perchlorate are below the threshold value of 1. The HQs for the American robin and desert shrew exposed to perchlorate and the desert shrew exposed to dioxins/furans have HQs greater than 1. As such, the potential risks to the desert shrew from exposure to dioxins/furans and to the American robin and desert shrew from exposure to perchlorate cannot be ruled out.

Exhibit 4-14b. Food Web Model Results Eco DU-3

Chemical	Eco DU-3 – Most Realistic Scenario HQ greater than 1 (UCL/LOAEL/AUF ≤ 1 HQ)	
	Desert Shrew	American Robin
Perchlorate	4	7
Dioxins/Furans	2	0.9

Notes:
Area Use Factor (AUF); ecological decision unit (Eco DU); upper confidence limit of the mean (UCL); lowest observed adverse effect level (LOAEL); hazard quotient (HQ)

The HQ is between 2 and 10.

4.6.2.5 Risk Characterization for Birds and Mammals: Parcel E

This section provides a summary of the results from the food web modeling for Parcel E.

Most Conservative: Parcel E HQs using Maximum EPCs, NOAEL TRVs, and AUFs equal to 1

The food web model results for Parcel E using the most conservative input values are provided in Table 4-8e (MAX/NOAEL column). A summary of the results indicate that the maximum EPC/NOAEL HQs exceed the threshold value of 1 only for dioxin/furan mammal and bird TEQs (HQs=2). HQs for perchlorate, boron and beta-BHC were below the threshold value of 1.

Next Level Conservative: Parcel E HQs using Maximum EPCs, LOAEL TRVs, with and without species-specific AUFs.

The food web model results for Parcel E using the next level conservative input values are provided in Table 4-8e (MAX/LOAEL column). A summary of the results indicate that the maximum EPC/LOAEL HQs are below the threshold value of 1 for each chemical/receptor combination regardless of whether the AUF is set at 1 or the species-specific AUF is used.

More Realistic: Parcel E HQs are calculated using the 95% UCL EPCs, NOAEL TRVs, and AUFs equal to 1.

The food web model results for Parcel E using more realistic input values are provided in Table 4-9e (UCL/NOAEL column). A summary of the results indicate that the 95% UCL/NOAEL HQs are 1 or below the threshold value of 1 for each chemical/receptor combination regardless of whether the AUF is set at 1 or the species-specific AUF is used.

Most Realistic: Parcel E HQs are calculated using the 95% UCL EPCs, LOAEL TRVs, with and without species-specific AUFs.

The food web model results for Parcel E using the most realistic input values are provided in Table 4-10e (UCL/LOAEL column). A summary of the results indicate that the 95% UCL/LOAEL HQs are below the threshold value of 1 for each chemical/receptor combination regardless of whether the AUF is set at 1 or the species-specific AUF is used.

4.6.2.6 Risk Summary for All OU-1 Refined SLERA Area Spatial Units

Overall, the food web modeling for birds and mammals indicates that most of the bioaccumulative chemicals detected in soil from within the OU-1 Refined SLERA Area are not present at concentrations that would pose an unacceptable risk to bird and mammal populations, as the NOAEL and LOAEL HQs are less than 1.

However, there were chemicals identified as constituents (or mixtures) that may pose potential unacceptable risks to birds and mammals within the OU-1 Refined SLERA Area, based on HQs developed using NOAEL and LOAEL TRVs, with the following caveats:

- NOAEL HQs greater than 1 indicate that adverse impacts cannot be definitively ruled out, but NOAELs by definition indicate "no effect" even for individual birds or mammals. So, exceeding a NOAEL HQ of 1 does not alone indicate that adverse impacts are likely to occur.
- LOAEL HQs greater than 1 could indicate that adverse impacts may be observable if conditions in the food web model accurately reflect exposures that occur to wildlife in the OU-1 Refined SLERA Area.

- At this time, the OU-1 Refined SLERA Area has little ecological habitat, so limited, if any, potential harm to wildlife occurs based on the current conditions in this area. Furthermore, the HQs are influenced by the uptake of chemicals into dietary items, which may be overestimated given the current habitat present in the OU-1 Refined SLERA Area. Uptake is often biased toward higher exposure in a SLERA. As such, it is not definitive that wildlife within the OU-1 Refined SLERA Area are exposed to constituents as high as may have been included in the model.

The summary below for each spatial unit includes the chemicals of interest and the results based on the realistic HQs, with the LOAEL as the most indicative of potential adverse impact and NOAELs for consideration but not as pertinent as the LOAEL HQs:

Operations Area:

- Perchlorate: The 95% UCL NOAEL HQs without using species-specific AUFs exceed a value of 1 for the desert shrew, fringed myotis, and American robin. The 95% UCL LOAEL HQ using a species-specific AUF for the American robin and desert shrew are 2 and 1, respectively. LOAEL HQs considering species-specific AUFs were less than or equal to 1 for the other species evaluated.
- Manganese: The 95% UCL NOAEL HQ without using species-specific AUFs is 4 for the desert shrew and 2 for the pocket mouse. The NOAEL and LOAEL HQs were less than 1 for the other four bird and three mammal species evaluated. The 95% UCL LOAEL HQs using species-specific AUFs are equal to or below 1 for each receptor included in the food web model.
- Dioxin/furan TEQ for mammals: the 95% UCL LOAEL HQ using a species-specific AUF is 4 for the desert shrew. The 95% UCL NOAEL HQ without species-specific AUFs is 10 for the desert shrew and fringed myotis and 2 for the raccoon. The 95% UCL NOAEL and 95% UCL LOAEL HQs (with and without species-specific AUFs) were below 1 for the other mammals evaluated.
- Dioxin/furan TEQ for birds: the 95% UCL LOAEL HQ using a species-specific AUF is 1 for the American robin. The 95% UCL NOAEL HQ without species-specific AUFs is 10 for the American robin and 5 for the burrowing owl. The 95% UCL NOAEL HQs (with and without species-specific AUFs) were less than 1 for the other two bird species evaluated.
- Other chemicals: 95% UCL NOAEL HQs without species-specific AUFs exceeded 1 for 4,4'-DDE, DDx, and HCB for several receptors but each of the 95% UCL LOAELs using species-specific AUFs for these constituents were below 1 for each receptor where NOAEL HQs exceeded 1.

Eco DU-1:

- Perchlorate: the 95% UCL LOAEL HQ using a species-specific AUF for the American robin is 2. 95% UCL LOAEL HQs were less than or equal to 1 for the other species evaluated. The 95% UCL NOAEL HQs without using species-specific AUFs exceed a value of 1 for the desert shrew, fringed myotis, and American robin.
- Manganese: the 95% UCL LOAEL HQ using species-specific AUFs is equal to or below 1 for each receptor included in the food web model. The 95% UCL NOAEL HQ without using species-specific AUFs is 4 for the desert shrew and 2 for the pocket

mouse. The 95% UCL NOAEL and LOAEL HQs (with and without species-specific AUFs) were less than or equal to 1 for the other 4 bird and 3 mammal species evaluated.

- Dioxin/furan TEQ for mammals: the 95% UCL LOAEL HQ using a species-specific AUF is 5 for the desert shrew. The 95% UCL NOAEL HQ without species-specific AUFs is 20 for the desert shrew and fringed myotis and 3 for the raccoon. The 95% UCL NOAEL and 95% UCL LOAEL HQs (with and without species-specific AUFs) were less than or equal to 1 for the other mammals evaluated.
- Dioxin/furan TEQ for birds: the 95% UCL LOAEL HQ using a species-specific AUF is 2 for the American robin. The 95% UCL NOAEL HQ without species-specific AUFs is 20 for the American robin and 6 for the burrowing owl. The 95% UCL NOAEL HQs (with and without species-specific AUFs) were less than 1 for the other 2 bird species evaluated.
- Other chemicals: 95% UCL NOAEL HQs without species-specific AUFs exceeded 1 for 4,4'-DDE, DDx, and HCB for several receptors but each of the 95% UCL LOAELs using species-specific AUFs for these constituents were below 1 for each receptor where NOAEL HQs exceeded 1.

Eco DU-2:

- Antimony: 95% UCL LOAEL HQs using a species-specific AUF for antimony were below 1 for each of the nine receptors. 95% UCL NOAEL HQs without species-specific AUFs for antimony were 2 for the desert shrew and the fringed myotis.
- 4,4'-DDE: DDE was identified based on 95% UCL NOAELs without species-specific AUFs, with HQs greater than 1 for the Cooper's hawk, burrowing owl, kit fox, fringed myotis, and desert shrew, but were less than or equal to 1 when considering UCL LOAEL HQs and species-specific AUFs for all receptors.
- DDx was identified based on 95% UCL NOAELs without species-specific AUFs, with HQs greater than 1 for the Cooper's hawk, kit fox, burrowing owl, American robin, desert shrew, and fringed myotis, but was less than 1 for all receptors when considering UCL LOAEL HQs.

Eco DU-3:

- Perchlorate: the 95% UCL LOAEL HQs using a species-specific AUF for the American robin is 7, and for the desert shrew is 4. The 95% UCL NOAEL HQs without species-specific AUFs exceed a value of 1 for the seven of nine receptors. The 95% UCL NOAEL HQs are less than or equal to 1 for the Cooper's hawk, kit fox, burrowing owl, fringed myotis, raccoon, and the mourning dove using species-specific AUFs.
- Dioxin/furan TEQ for mammals: the 95% UCL LOAEL HQs are below 1 for all mammals except the desert shrew (HQ=2) using species-specific AUFs. The NOAEL HQs without species-specific AUFs were less than or equal to 1 for all mammal species except the desert shrew and fringed myotis (HQs=8).
- Dioxin/furan TEQ for birds: the 95% UCL LOAEL HQs using a species-specific AUF do not exceed 1 for any bird species evaluated. The 95% UCL NOAEL HQ without species-specific AUFs for the burrowing owl is 3 and for the American robin is 9. The UCL NOAEL HQ is less than 1 for the burrowing owl when the species-specific AUF is

considered. The American robin has a home range smaller than or equivalent to the OU-1 Refined SLERA Area so using an AUF of 1 or a species-specific AUF does not influence the results.

- 4,4'-DDE was identified based on 95% UCL NOAELs without species-specific AUFs, with HQs greater than 1 for the desert shrew, burrowing owl, kit fox, and the Cooper's hawk; however, all 95% UCL NOAELs using a species-specific AUF were below an HQ of 1 except for desert shrew (HQ=2).
- HCB was identified based on 95% UCL NOAELs without species-specific AUFs, with HQs greater than 1 for the American robin, but the 95% UCL LOAEL HQs with and without a species-specific AUF were below 1.

Parcel E:

- The 95% UCL NOAEL and LOAEL HQs for all constituents were equal to or below 1 for each of the nine receptors.

The risk characterization results table provided below summarizes the chemicals and the wildlife receptors with the greatest potential for risk from exposure to chemicals within the Operations Area and Parcel E (the OU-1 Refined SLERA Area). The results are based on the 95% UCL NOAEL and 95% UCL LOAEL HQs. The LOAEL HQs are more indicative of potential adverse impact. The NOAEL HQs are included for completeness but are not as informative as the LOAEL HQs.

The risk characterization summary table below provides 95% UCL NOAEL and LOAEL risk results for the wildlife evaluated in the OU-1 Refined SLERA Area for only those COPECs and receptors with 95% UCL LOAEL HQs greater than 1 using species-specific AUFs. The 95% UCL LOAEL HQs did not exceed the threshold value of 1 for the Cooper's hawk and pocket mouse. Therefore, risks are not expected for these species and HQ results for these two receptors are not shown in the exhibit below. Both the 95% UCL NOAEL and LOAEL HQs were below 1 for the kit fox, fringed myotis, raccoon, and mourning dove and are therefore not shown in the table below. Only the burrowing owl, American robin, and desert shrew have 95% UCL LOAEL HQs greater than 1 for at least one COPEC (perchlorate and/or dioxins/furans), as summarized in Exhibit 4-14c below.

Notes:

(a) Most wildlife species evaluated did not have LOAEL HQs exceeding the threshold value of 1 and therefore, no unacceptable risks are anticipated for those species (Great Basin pocket mouse, the kit fox, raccoon, mourning dove, fringed myotis, and the Cooper's hawk).

(b) The western burrowing owl, American robin, and desert shrew have relatively small home ranges and they do not use species-specific area use factors less than one.

Legend:

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100

(c) HQs less than 1 are not reported here with full precision. They are available in Appendix I.

Ecological Decision Unit (Eco DU); Hazard quotient (HQ); no observed adverse effects level (NOAEL); lowest observed adverse effects level (LOAEL); upper confidence of the mean (UCL); toxicity reference value (TRV).

The risk characterization summary table above illustrates the following focusing on the 95% UCL LOAEL results:

- Perchlorate and dioxins/furans contribute the greatest overall risk.
- The desert shrew and American robin are the wildlife receptors at greatest risk for exposure to perchlorate and dioxins/furans but risks to burrowing owl are also potential to a lesser extent primarily from exposure to soils within Eco DU-1.
- HQs are highest in Eco DU-1 for dioxins/furan and for perchlorate in Eco DU-3.
- In Eco DU-2, potential risks to the American robin and desert shrew from exposure to DDE (desert shrew) and DDx (American robin and desert shrew) cannot be ruled out.
- In Eco DU-3, the greatest risk is from exposure of perchlorate and dioxins/furans to the American robin and desert shrew.
- While NOAEL HQs exceed 1 for 4,4'-DDE (Eco DU-1), manganese (Eco DU-1) and HCB (Eco DU-1 and Eco DU-3), all LOAEL HQs for these constituents are less than or equal to the threshold value of 1.
- Risk is negligible in Eco DU-2, Parcel E as NOAEL HQs are low, and LOAEL HQs are all less than or equal to 1.

4.6.2.7 Risk Characterization for Reptiles

The risk characterization for reptiles is based on generalizations derived from the evaluation of terrestrial invertebrates, birds, and mammals because there are no specific TRVs for reptiles. There is no habitat for amphibians within the OU-1 Refined SLERA Area as discussed in Section 2.1.6; therefore, they are not included as a receptor in the OU-1 Refined SLERA. As such, the food web modeling for birds and mammals indicates that most of the bioaccumulate chemicals detected in soil from the OU-1 Refined SLERA Area are not present at concentrations that would pose an unacceptable risk to birds and mammals, as the NOAEL and LOAEL HQs are less than 1. So, risks to reptiles are not expected for these chemicals. The risks to reptiles cannot be ruled out for the chemicals identified for mammals and birds.

4.7 Characterization of Uncertainties

The characterization of uncertainty is a component of the ERA process (USEPA 1997). The ERA process seeks to reduce uncertainty (when possible) through the use of site-specific information. The uncertainties identified herein are relevant to each of the five spatial units evaluated in this OU-1 Refined SLERA. Uncertainties associated with the food web model attributes are discussed below and detailed in Table 4-11.

Uncertainties are found in each stage of the ERA process including in the hazard identification, the use of chemical and biological data in the exposure assessment, in the

effects assessment, and in the risk characterization. Examples of key uncertainties in the ERA process in general include:

- Use of maximum concentrations to characterize potential risks, which reflects the maximum exposure potential and is unlikely because wildlife is not typically exposed to the maximum concentration of each chemical throughout the landscape.
- Use of the 95% UCL based on sampling intended to characterize the highest concentrations likely to be present at the Site because this sampling approach is intended to characterize impacted areas and not areas that have not been impacted.
- Use of ESVs from laboratory studies on sensitive organisms that may or may not reflect sensitivities of organisms at the Site.
- Uncertainties that exist in ecological food web modeling, such as the use of standardized receptor parameters, which are based on a single value which is generally conservative. Natural wildlife has a normal range of BWs and dietary intake. In addition, the dietary preferences for birds and mammals at the Site may vary from those parameters used in the food web model, which reflect typical food items.
- Uncertainties in the risk results stem from the significant variability inherent in the uptake values used in food web models. Specifically, the BAFs used in the food web model obtained from the literature can range over several orders of magnitude, as is discussed further in Appendix J-4.
- AUFs may not reflect actual organism use of the Site, particularly given human disturbances at the Site.
- Conservative toxicological benchmarks are used to quantify the range of potential risks and generally consider the most sensitive organisms. Not all plants, soil invertebrates, birds and mammals are as sensitive to chemicals as the most sensitive organisms. So, it is possible that some risks may be overestimated. Also, toxicological benchmarks are based on species that can be tested in a laboratory environment and benchmarks are not available for all species likely to be present at the Site.
- HQs reflect potential risks to individual organisms and do not directly indicate population level impacts. The potential risks to populations must be inferred based on the magnitude of HQs. Also, the HQs provided in this OU-1 Refined SLERA include NOAEL concentrations and LOAEL concentrations to provide insight into potential population level impacts.
- There is limited toxicity information for reptiles. The risk to these taxa can be qualitatively compared to birds and mammals and general statements about potential risks to reptiles can be made, but uncertainties in extrapolating between birds/mammals and reptiles exist as detailed in Section 4.7.7.

Specific uncertainties that influenced the OU-1 Refined SLERA are briefly described in the following subsections.

4.7.1 Detected Chemicals Lacking ESVs

Some chemicals were detected in the OU-1 Refined SLERA Area that lack ESVs, as indicated on Tables 3-3a through 3-3e, and Appendix J-1. Spatial plots for each detected constituent with no ESV are also provided in Appendix J-1. In the Operations Area (that include Eco DU-1, Eco DU-2, and Eco DU-3), these chemicals are:

- General Chemistry: ammonia, bromide, ortho-phosphate, sulfate, nitrate, and nitrate
- Metals: magnesium and sulfur
- SVOCs: octachlorostyrene
- VOCs: formaldehyde
- Chlorine oxyanions: chlorate

In Parcel E, the chemicals are:

- General chemistry: ammonia, bromide, nitrate, and sulfate
- Chlorine oxyanions: chlorate

A summary of the information available for these constituents lacking ESVs are provided in Table 4-12a (Operations Area, including the three Eco DUs) and Table 4-12b (Parcel E), including the frequency of detection, AVG, 95% UCL, and maximum concentrations. These constituents were initially considered in the screening provided in Section 3 of this report. Since there are no ESVs given the multiple sources considered, as described in this OU-1 Refined SLERA, this uncertainty assessment provided in Table 4-12a and 4-12b considered 95% UCL concentrations exceeding background concentrations and a frequency of detection exceeding 10%. Several of the constituents that lack an ESV likely do so because they are essential nutrients and are not considered toxic. These include sulfate, nitrate, nitrite, magnesium, and sulfur. Risks to chemicals lacking ESVs cannot be definitively ruled out, but the following observations are made:

4.7.1.1 General Chemistry

- Ammonia: Detection frequency = 26%, the maximum detected is in Eco DU-1 in an ECA just north of Eco DU-3, and the 95% UCL concentration = 77.7 mg/kg. A spatial plot for ammonia is provided in Appendix J-1.1a (Figure J-1.1a). Ammonium rarely accumulates in soil because bacteria will rapidly convert the ammonium that is not taken up by plant roots into nitrates (nitrification).
- Bromide has a detection frequency of 9%. A spatial plot for bromide is provided in Appendix J-1.1b (Figure J-1.1b). The low frequency of bromide indicates that this constituent is not ubiquitous throughout the Site and is not expected to contribute significantly to overall risk. Additionally, USEPA conducted a risk assessment for bromide and found that bromide is "practically non-toxic to avian species" with LC50s of > 5,600 mg/kg. USEPA reported LC50s based on oral toxicity to rats (as a surrogate for terrestrial mammals) as >3,900 mg/kg (USEPA 2005). The concentrations of bromide within the Operations Area and Parcel E are 4.7 mg/kg and 15 mg/kg, respectively. As such, bromide is not expected to contribute to potential risk to birds and mammals that may visit the Site.

4.7.1.2 Nitrates and Nitrites

- Spatial plots for nitrates and nitrites are provided in Appendix J-1.1, Figure J-1.1c (nitrate) and Figure J-1.1d (nitrite).
- Nitrite: Detection frequency = 12%, and the location with the maximum detected concentration is SA-15 in Eco DU-3. The 95% UCL concentration is 1.1 mg/kg.
- Nitrate: Detection frequency = 95%, and the location with the maximum detected concentration is SA-15 in Eco DU-3. The 95% UCL concentration is 1.1 mg/kg.
- Nitrate/Nitrite: Detection frequency = 100%, and the location with the maximum detected concentration is RISB-01 in Eco DU-1. The 95% UCL concentration is 53.2 mg/kg.
- Nitrites and nitrates are part of the nitrogen cycle and is an is an essential element for the survival of plants (as well as animals) because of its use in the creation of amino acids, and therefore, the formation of proteins. This is very likely the reason there are no ESVs for nitrite as it is not an inherently toxic chemical.

4.7.1.3 Ortho-phosphate and Sulfate

- Spatial plots for the ortho-phosphate and sulfate are provided in Appendix J-1.1, Figure J-1.1e and Figure J-1.1f, respectively.
- Ortho-phosphate: Detection frequency = 13%, and the maximum detected concentration is in Eco DU-1 in an ECA just north of Eco DU-3. The 95% UCL concentration = 96 mg/kg. Given that ortho-phosphate was detected at a low frequency it is unlikely to present a risk to ecological receptors within the OU-1 Refined SLERA Area.
- Sulfate: Detection frequency = 99%, and the location with the maximum detected concentration is SA-28 in Eco DU-2. The 95% UCL concentration = 1,800 mg/kg. Sulfate is an essential nutrient and is among the most important macronutrients in cells. Sulfate occurs naturally in soils, sediments, and rocks. Fertilizers are supplemented with sulfate to assist in crop yield.

4.7.1.4 Metals

- Magnesium: Detection frequency = 99%, and the maximum detected concentration is DS-DB-1 in Eco DU-1. The 95% UCL = 18,800 mg/kg. Magnesium is an essential nutrient. It enables key metabolic processes, contributes to bone strength, and acts as a cofactor in hundreds of enzymatic reactions. A magnesium spatial plot is provided in Appendix J-1.3, Figure J-1.3a.
- Sulfur: Detection frequency = 78%, and the location with the maximum detected concentration is RISB-14 in Eco DU-1. The 95% UCL concentration is 2,480,0 mg/kg. Sulfur is an essential plant nutrient necessary for the growth and development of plants. A sulfur spatial plot is provided in Appendix J-1.3, Figure J-1.3b.

4.7.1.5 VOCs/SVOCs

- Octachlorostyrene: Detection frequency = 16%, and the location with the maximum detected concentration is RSAJ5 in Eco DU-1 (spatial plot provided in Appendix J-1.4, Figure J-1.4d). The 95% UCL concentration is 1.04 mg/kg. Toxicity data on

octachlorostyrene is very limited, particularly for terrestrial organisms. However, given that low frequency of detection, it is unlikely that octachlorostyrene presents a widespread risk to ecological receptors within the OU-1 Refined SLERA Area. While octachlorostyrene is susceptible to direct photolysis (Hustert et al. 1984), it is not expected to volatilize from dry soil surfaces based upon an estimated vapor pressure of 1.3X10-5 mm Hg. Octachlorostyrene is expected to be immobile in soil and is not expected to volatilize from dry soil surfaces (Oliver et al. 1986).

- Formaldehyde: Detection frequency = 100%, but only two samples were collected, as indicated in the spatial plot in Appendix J-1.5, Figure J-1.5d. The location with the maximum detected concentration is SA-85 in Eco DU-1. The 95% UCL concentration of formaldehyde within the OU-1 Refined Study Area is 0.089 mg/kg. The lowest plant NOEL found in the literature was 0.045 mg/kg (Barker and Shimabuku 1992). Formaldehyde is readily biodegradable and does not accumulate in biological tissues. In the environment, formaldehyde is quickly broken down in the air by sunlight or by bacteria in soil or water (ATSDR 1999). Under atmospheric conditions, formaldehyde is readily photo-oxidized in sunlight to carbon dioxide. It reacts relatively quickly with trace substances and pollutants in the air so that its half-life in urban air, under the influence of sunlight, is short. The half-life of formaldehyde is approximately 50 minutes during the daytime.

4.7.1.6 Chlorine Oxyanions

- Chlorate: Detection frequency = 77%. The location with the maximum detected concentration is SA-186 within Eco DU-1, with a spatial plot for chlorate provided in Appendix J-1.2, Figure J-1.2a. The 95% UCL concentration is 100 mg/kg. Sodium chlorate persists in soil for 6 months to 5 years depending on the rate applied, soil type, fertility, organic matter, moisture, and weather conditions (Klingman 1975). Sodium chlorate is known to be toxic to humans and is therefore likely to be toxic to mammals and possibly birds. Given that concentrations of chlorate are similar to that of perchlorate within the OU-1 Refined SLERA Area, chlorate cannot be ruled out as a contributor of risk to ecological receptors within the OU-1 Refined SLERA Area, particularly in Eco DU-1 and Eco DU-2 where concentrations are highest.

4.7.2 Detected Chemicals Lacking Species-Specific ESVs

The plant and invertebrate evaluations identified constituents that do not have ESVs. In addition to the constituents provided in Table 4-2a, bis(2-ethylhexyl) phthalate lacks a plant-specific ESV, and boron lacks an invertebrate-specific ESV. However, bis(2-ethylhexyl) phthalate is detected in only 10% of samples and is therefore unlikely to pose a risk to the few plants within the OU-1 Refined SLERA Area. An uncertainty analysis for chemicals detected but lacking plant-specific ESVs is provided in Table 4-12c.

Boron concentrations that result in toxicity to soil invertebrates are not available in the literature. The ESV available for boron is based on toxicity to birds, but boron is not bioaccumulative, so it is not included in the food web model. Given the lack of information on the toxicity of boron to soil invertebrates, boron cannot be ruled out as potentially causing risk to soil invertebrates within the OU-1 Refined SLERA Area. An uncertainty analysis for chemicals detected but lacking invertebrate-specific ESVs is provided in Table 4-12d.

4.7.3 Evaluation of Chemicals with Low Detection Frequencies

All detected chemicals with HQs using concentrations were retained for further evaluation in the OU-1 Refined SLERA regardless of detection frequency. The following chemicals had a detection frequency of less than 5%.

- Dimethoate
- Stirophos
- 2-Chloronaphthalene
- 4-Chloro-3-methylphenol
- Isophorone
- Bromodichloromethane
- Chloromethane
- Ethyl tert-butyl ether
- Methyl tert-butyl ether
- Tert-Butyl alcohol

Spatial plots for each of these chemicals is provided in Appendices J-1, Figures J-1.4a through J-1.6b. Each of the chemicals listed above were evaluated using a food web model and soil concentrations. The 95% UCL concentration cannot be calculated for these chemicals because of their small sample size. Even applying the most conservative assumptions (soil concentrations, AUF of 1, and NOAEL TRVs), the HQs for each of the nine receptors was less than 1 as shown in Table 4-13. Based on consideration of spatial plots and the food web modeling provided in Table 4-13, risks are not considered likely for these chemicals.

4.7.4 Uncertainties in the Background Evaluation

An uncertainty evaluation was conducted to better understand the occurrences of background concentrations greater than concentrations in the Operations Area and in each of the OU-1 Refined SLERA subareas to confirm the suitability of this background dataset for use in the OU-1 Refined SLERA. Nonparametric and parametric statistical tests were used to determine whether concentrations of chemicals in soil were significantly different than background concentrations for the 49 constituents[18] analyzed at OU-1. Each of the four statistical tests used in the OU-1 Refined SLERA detailed in Section 2.1.5.2 were re-evaluated for chemicals where background concentrations were greater than concentrations within the Operations Area.

Tables E-2b, E-2d and E-2I includes several p-values that are equal to 1. In a 1-sided test this implies a strong significant difference between background and site data, where site data are lower than background. There are a few locations within the OU-1 Refined SLERA Area where concentrations for some metals are less than the BRC/TIMET Regional Background Dataset (2007) on which background comparisons are performed. Because

[18] The 49 constituents included in the background evaluation include metals, radionuclides and inorganic constituents shown in Tables E-2a, E-2c and E-2g.

these metals had concentrations below the regional background concentrations, they were eliminated from further evaluation.

Only five chemicals had background concentrations greater than concentrations in the Operations Area with agreement among all applicable statistical tests. Several other chemicals showed background concentrations greater than OU-1 for at least one of the applicable statistical tests, but other tests showed no statistically significant difference between background and OU-1 concentrations.

Of the five constituents with background concentrations greater than concentrations in the Operations Area in all applicable statistical tests, the following Eco DU specific observations can be made:

- Beryllium: Concentrations are consistent between Eco DU-1, Eco DU-2 and Eco DU-3 and concentrations in each of these three DUs are marginally below background. Beryllium was not analyzed in Parcel E.
- Total Phosphorous: Concentrations are consistent between Eco DU-1, Eco DU-2, Eco DU-3 and Parcel E. Concentrations in each of the four subareas are below background.
- Silicon: Concentrations are consistent between Eco DU-1, Eco DU-2 and Eco DU-3 and concentrations in each of these three DUs are below background. Silicon was not analyzed in Parcel E.
- Strontium: Concentrations are generally consistent between Eco DU-1, Eco DU-2, Eco DU-3 and Parcel E. Background is greater than Eco DU-1 in all applicable statistical tests, background is greater than Eco DU-2 in at least one but not all applicable statistical tests, and background is consistent with Eco DU-3 and Parcel E. The HQ using the 95% UCL soil concentrations in the Operations Area is equal to 2.
- Radium-228: Concentrations of radium-228 vary between subareas, but all four subareas have radium-228 concentrations below background in at least one but not all applicable statistical tests. Concentrations within the four subareas are highest in Eco DU-3, followed by Eco DU-2, Eco DU-1, and Parcel E with the lowest concentrations.

Exhibit 4-15 below provides a summary of constituents with background concentrations in soil that exceed concentrations in subarea soils using all applicable statistical tests. Despite these constituents having concentrations lower than background, soil concentrations for these constituents were compared to ESVs as an additional measure of potential risk. ESVs for total phosphorous, silicon, and zirconium are not available in the literature.

HQs using maximum soil concentrations for beryllium, thorium-230, uranium-234, and uranium 238 are all below a value of 1. The HQ using the maximum soil concentrations for radium-228 is 2 but the HQ using the 95% UCL concentration is equal to 1. These results indicate that these constituents are unlikely to pose a risk to ecological receptors. The HQ for strontium using maximum and 95% UCL soil concentration resulted in HQs of 4 and 2, respectively. As the concentrations of all of these constituents are below background, it cannot be ascertained as to whether these chemicals are of man-made origin or simply a reflection of the regional geology. As such, these constituents detected below background do not pose an unacceptable risk to ecological receptors within OU-1.

Exhibit 4-15. Constituents with Backgorund Soil Concentraitons Greater than Site Concnetraitons Compared to ESVs

Area	Chemical Name	Units	Max Detection	95% UCL	SLERA ESV	ESV Source	MAX HQ	95% UCL HQ

Notes: NC = No Criteria; HQ = Hazard Quotient; mg/kg = milligram per kilogram; pCi/g = picocuries per gram; LANL Min NOAEL TRV = Los Alamos National Laboratory minimum no observable adverse effect lever toxicity reference value; Eco-SSL = USEPA (1999) Ecological Soil Screening Levels.

In principle, site concentrations should not be lower than concentrations in a background data set that is perfectly representative of natural site conditions. However, there are several possible explanations for this situation:

- Anthropological influence resulting in metals leaching from the soil matrix. These influences may include acid or solvent spillage during operational periods, or perhaps leaking pipes near the area (e.g., those that transport water back to Las Vegas from Lake Mead). This has been a working hypothesis of NDEP since approximately 2010.
- While appropriately selected background data sets are reasonable approximations of naturally occurring concentrations within OU-1, geologic formations are naturally heterogeneous and variable in both random and systematic ways, and it is not possible to guarantee that any background data set will perfectly represent all naturally occurring concentrations at a given site.
- Natural variability within a single geologic unit resulting (as a result of geologic processes during deposition or reworking of surface soils by wind and water causing minor sorting of sediments) in a background data set that approximates but is not perfectly representative of natural site conditions.
- Sampling bias, caused by a difference in the number of samples, depth, or distribution of samples, may result in a background data set that approximates, but is not perfectly representative of natural site conditions.
- Analytical differences between the site and background investigations may result in observed systematic differences between the data sets.

- The RZ-A background dataset from the southern portion of OU-1 was not used in the OU-1 Refined SLERA. The RZ-A area was included as part of the OU-1 Refined SLERA site data set because animals were observed in this area. The RZ-A background dataset was approved by NDEP for human health risk in the southern portion of OU-1 because concentrations in that area were sometimes observed to be below the BRC-TIMET background dataset. The absence of the RZ-A background dataset may contribute to high *p*-values (where BRC-TIMET background concentrations are greater than site concentrations).

Despite the few instances where background concentrations in soil were greater than OU-1 soil concentrations, the BRC/TIMET Regional Background Data Set (2007) approved by NDEP is suitable for use in this refined SLERA.

The site concentrations being lower than background concentrations is likely caused by combination of natural geologic variability, analytical factors, and sampling bias, resulting in a background data set that approximates natural site conditions but is not perfectly representative. With the natural variability of alluvial geology, even within a single geologic unit, and additional natural variability caused by wind and surface water, it is unlikely to obtain a perfect representation of local background for every relevant subset of data across this study area. Therefore, not every variance between site and background data must be due to anthropological influence or analytical issues. Regardless of the reasoning, the fact that site concentrations are lower than background is not a concern regarding remediation decisions. If the working hypothesis of NDEP in the first bullet point listed above is true, the anthropological influences could have implications for potential groundwater transport of chemicals. However, the geochemistry of the OU-1 groundwater is relatively consistent, generally exhibiting oxidizing conditions across the Site. The mechanism for releasing metals from the soil matrix is therefore not clear. Evaluation of deeper soil concentrations and groundwater concentrations is presented in the RI Report for OU-1 and OU-2 (Ramboll 2023b). However, deeper soil and groundwater are not evaluated in this OU-1 Refined SLERA as wildlife exposure to deep soil and groundwater is not a complete exposure pathway at OU-1 per the OU-1 Work Plan (Ramboll Environ 2015).

4.7.5 Uncertainties in the Evaluation of DDT and Metabolites

Organochlorine pesticides, including 4,4'- DDT, the isomers of DDT, 2,2' and 2,4'- DDD, and 2,2' and 2,4'- DDE are summed to a DDx value for the evaluation of potential risks related to the chemical mixture. Not all locations were analyzed for all isomers. As such, the DDx sums are comprised of three to five isomers depending on the location. The sum of DDx values and how they are calculated by location is provided in Appendix D, Table D-7. The 4,4'-DDD, 4,4'-DDE, and 4-4'-DDT isomers were analyzed for all samples collected for DDT and metabolite analysis. 2,4'-DDE and 2,4'-DDD were only analyzed on a subset of samples. 2,4'-DDT was not analyzed at any locations within OU-1. The variability in the DDx isomers is related to the different sampling scope of work or study designs that occurred over time at the OU-1 Refined SLERA Area. Because not all isomers are included in every sample, calculating the sum of DDT and metabolites is a potential underestimation of risk given the lack of isomers at any particular location.

To address this uncertainty, a sensitivity analysis was conducted to determine the potential underestimation of risk from the exclusion of 2,4'- isomers in the Operations Area. This analysis included an upward adjustment of total DDx concentrations in samples that were

not analyzed for 2,4'-DDE using the ratio of 2,4'-DDE to Total DDx in Operations Area samples with detected concentrations of 2,4'-DDE. Revised summary statistics were calculated, and a limited food web model using the most highly exposed organism, the desert shrew, was completed to quantify the potential underestimation of risk from not analyzing 2,4'-DDE. It should be noted that 2,4'-DDT was not analyzed in any samples. and 2,4'-DDD was analyzed in only 7 samples, but never detected. Therefore, a quantitative analysis of potential underestimation from these two isomers is not possible.

Outcomes of this analysis are summarized below.

- 2,4'-DDE was measured in 44 of 126 soil samples in the operations area, and was detected in 18 of those samples.
- For these 18 samples, 2,4'-DDE represents between 1.9% to 45% of the total DDx concentration, with an average of 25%. Note: Calculation of total DDx includes non-detected isomer concentrations as ½ the sample quantitation limit.

Compound	No. Detects	Minimum (%)	Average (%)	Maximum (%)
2,4'-DDE	18	1.9	25	45

- Increasing all total DDx concentrations in the remaining 88 soil samples (where 2,4'-DDE was not measured) by 25% results in an increase in the total DDx 95% UCL concentration from 0.189 mg/kg in the initial analysis to 0.264 mg/kg in this sensitivity analysis, as shown in the following summary statistics:

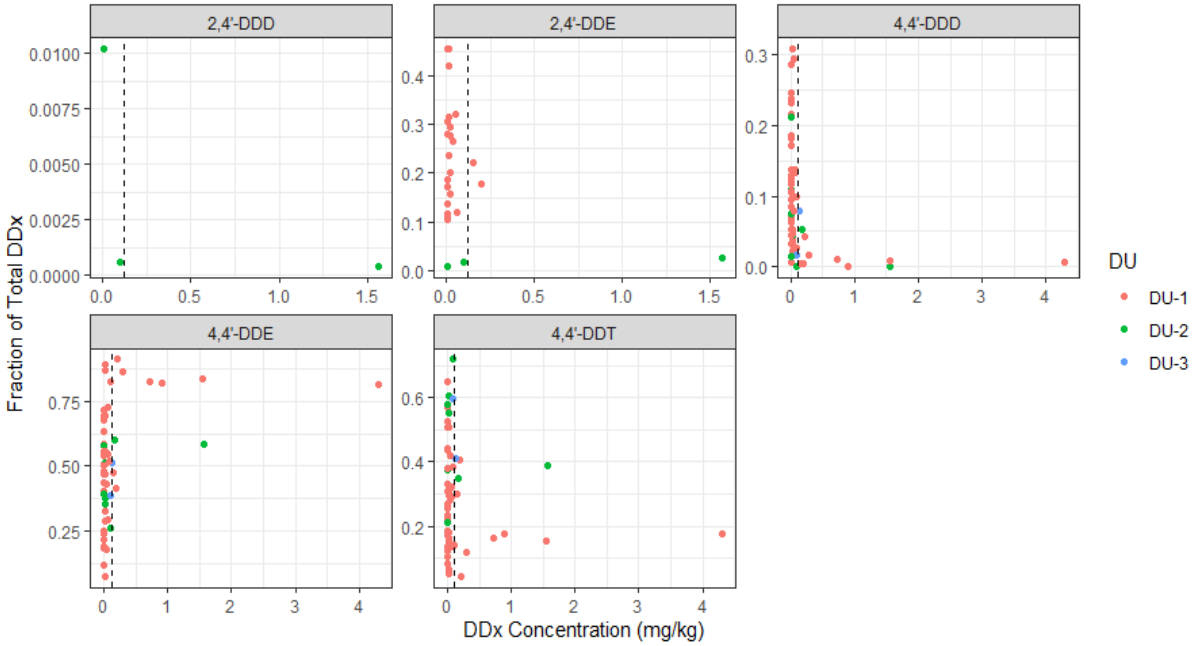
Analysis	No. Detects	No. of Samples	Average (mg/kg)	95% UCL (mg/kg)	Maximum (mg/kg)
Initial Analysis	60	126	0.0935	0.189	4.30
Sensitivity Analysis	60	126	0.112	0.264	5.38

- The table below shows HQs for desert shrew, the species most sensitive to exposure to DDx, from the sensitivity analysis compared to that in the initial evaluation included in this Refined SLERA. Adjusting the 82 sample concentrations that did not contain 2,4'-DDE up by 25% had a minor effect on the outcomes of this analysis. Most notably, (1) the UCL/NOAEL HQs, which represent a more realistic evaluation of risk than using maximum concentrations, did not change when the DDx concentrations were increased by 25%, and (2) the most realistic evaluation of risk, the UCL/LOAEL HQs, are below 1 in both the intital evaluation and when the DDX concentrations were increased by 25%. It should be noted that when adjusting total DDx concentrations, the detection status was not considered, so even samples with all non-detected isomer concentrations were adjusted up 25%.

Risk Scale	Scenario	HQ (Initial)	HQ (Sensitivity)
Most Conservative	MAX/NOAEL	40	50
Next Level Conservative	MAX/LOAEL	7	9
More Realistic	UCL/NOAEL	2	2
Most Realistic	UCL/LOAEL	0.3	0.4

Notes: lowest observed adverse effect level (LOAEL); no observed adverse effect level (NOAEL); maximum concentration (MAX); upper confidence level (UCL) of the mean concentration. The most reliable measure of potential risk to wildlife is the UCL/LOAEL HQ.

The isomer fractional abundance by Total DDx concencentration in the Operations Area is shown below. Please note the different x-axis scales. Non-detected results are included as ½ the SQL. The dashed line represents a soil concentration (0.118 mg/kg) that would result in a DDx HQ of 1 for the most exposed organism, the desert shrew, and the NOAEL TRV of 0.147 mg/kg bw/d.



The following observations can be made from the graphs provided above:

- Isomers are most frequently found in Eco DU-1 with only very few isomers detected or analyzed in DU-2 and even fewer in DU-3.
- The vast majority of samples are below the conservative risk-based soil concentration of 0.118 mg/kg that would result in an HQ of 1 for the desert shrew.
- For samples above the risk-based criteria, 4,4'-DDE appears to be the dominant isomer.
- 2,4'-DDD was only measured in Eco DU-2 and never detected.

- 4,4'-DDE appears to make up a larger fractional abundance to total DDx than the contribution from the other isomers followed by 4,4'-DDT.

4.7.6 Evaluation of Detection Limit Uncertainties

USEPA SW846 analytical methods used for testing typically include many compounds that may not have any history of use at a given site. Therefore, constituents not detected are typically not considered likely to pose an unacceptable risk. However, as part of an uncertainty assessment, the constituents not detected are evaluated by consideration of SQLs in comparison to ESVs to identify where elevated detection limits or low ESVs may influence the understanding of potential risks.

This uncertainty analysis for the Operations Area provides clarity on where SQLs were elevated due to dilutions and discusses where the ESV was low and yielded elevated ratios. This analysis indicates that there are no specific chemicals that require further evaluation, despite some of the elevated ratios discussed in this section. As such, this uncertainty does not change the conclusions of this risk assessment.

The evaluation of detection limits (i.e., sample quantitation limits) in comparison to ESVs for constituents analyzed but not detected is also provided in Appendix J-2. Specifically, the ratio of SQLs to ESVs is provided. This ratio is similar to an HQ mathematically, but since the constituent was not actually detected, it is referred to as a ratio for this discussion.

Appendix J-2 provides the following tables:

- Tables J-2a and J-2b: Location-Specific Evaluation of SQLs for Constituents Not Detected for Operations Area and Parcel E, respectively, sorted by chemical.
- Tables J-2c and J-2d: Location-Specific Evaluation of SQLs for Constituents Not Detected for Operations Area and Parcel E, respectively, sorted by location.
- Tables J-2e and J-2f: Summary of SQLs, Ratios for SQLs/ESVs, and the Frequency of Exceedances of SQLs for the Operations Area and Parcel E, respectively, sorted by chemical.

The constituents with quantitation limits that exceed ESVs are identified, with the ratios sorted from highest to lowest, and showing the constituent detected, the location where it was detected, the SQL for the sample, and the ratio (Appendix J-2). Overall, the SQLs for constituents were suitable for this OU-1 Refined SLERA, as the ratios for SQLs and ESVs for many constituents not detected were less than 1. The list of constituents not detected with and without ESVs for the Operations Area (that includes Eco DU-1, Eco DU-2, and Eco DU-3) and Parcel E are provided in Appendix J-2 and J-3.

Thirty-three chemicals that were not detected within the OU-1 Refined SLERA Operations Area have one or more SQLs that exceed their respective ESVs, resulting in SQL/ESV ratios ranging from 3 to 10,000 based on the maximum SQL. Some of these SQLs are influenced by dilutions and some reflect the very low ESVs. These are discussed further below.

A detailed evaluation of these 33 chemicals is provided in Appendix J-2. Each chemical was evaluated using multiple criteria including SQL/ESV ratio, the percent of SQL/ESV HQs greater than 1, dilution factors, the basis of the ESV for that chemical, whether the chemical was retained for evaluation in the OU-1 RI, spatial characteristics (i.e., evaluation of potential hotspots or localized releases), and comparison to perchlorate as a key chemical of

concern in the OU-1 RI and OU-1 Refined SLERA. Spatial plots for each of the chemicals not detected with SQLs greater than ESVs are provided in Appendix J-2.

The magnitude of the SQL/ESV ratios and the percent of ratios greater than 1 are discussed below. The ratios are based on the maximum SQL and the minimum ESV, reflecting a very conservative assessment of potential uncertainty in this Refined SLERA. These chemicals are discussed as follows for the Operations Area:

- Chemicals not detected with maximum SQL/ESV ratios 3 to 50 are summarized in Exhibit 4-16a.
- Chemicals not detected with maximum SQL/ESV ratios of 50 to 1,000 are summarized in Exhibit 4-16b (note the maximum ratio is 500).
- Chemicals not detected with the maximum SQL/ESV ratios of 1,000 to 10,000 are summarized in Exhibit 4-16c (note there are no ratios between 500 and 1,000).

Exhibit 4-16a. Constituents Not Detected with Maximum SQL/ESV Ratios 3 to 50 (And Frequency of Minimum SQL/ESV Ratios Greater Than 1)

Cyanide (96%) All DFs=1	Chlorpyrifos (100%) All DFs=1	Pentachlorophenol (4%); All DFs 1x-2x
Heptachlor (20%); DFs 5x-100x	Diazinon (100%) All DFs=1	n-Nitrosodiphenylamine (4%); All DFs=1x-4x
Alpha-chlordane (19%); DFs= 5x-100x	Simazine (100%) All DFs=1	4-Chloroaniline (4%); All DFs=2x
Gamma-BHC (18%); DFs=1x-100x	2,4-Dichlorophenol (16%) All DFs=1x-2x	Bromomethane (9%); All DFs=1x
Dieldrin (16%) DFs=5x-100x	2-Methylphenol (16%) All DFs=1x-2x	

Notes: Values in parentheses indicate the percent of ratios greater than 1.
Ecological screening value (ESV); sample quantitation limit (SQL)
Dilution factors (DFs) provided indicate the range for the elevated SQL/ESV ratios exceeding 1.

The chemicals listed in Exhibit 4-16a have low SQL/ESV ratios (3 to 50 based on maximum SQLs and lowest ESVs). Some of these chemicals only had ratios in the 3 to 40 range for a very low percentage of samples where SQLs exceed ESVs (e.g., pentachlorophenol, n-nitrsodiphenylamine, and 4-chloroanaline only had 4% of SQLs exceeding ESVs).

Collectively, the chemicals listed in Exhibit 4-16a were eliminated from further consideration in this OU-1 Refined SLERA because (1) the constituents were not detected, (2) the ratios were low in general (3 to 40), (3) the low frequency of ratios exceeding a value of 1 using SQLs as provided from the laboratory, and (4) the ratios would be even lower if one half the SQL is used, as is also considered reasonable for consideration of non-detections in risk assessment (i.e., if half the SQL was used, the ratios in Exhibit 4-16c would be 1.5 to 25). Additionally, the ESVs are based on highly conservative models versus actual toxicity testing. For example, chloryifos, diazinon, and simazine all have SQLs exceeding ESVs, indicating that the ESVs are low compared to the SQLs. For these constituents, the sample dilution factors did not cause elevated SQLs that contributed to the ratios. Some of the chemicals, such as cyanide, had low SQL/ESV ratios and all dilution factors of 1, but almost

all HQs exceeded a value of 1, which indicates a low ESV influenced the ratio. The spatial plots provided in Appendix J-2 do not indicate the presence of localized releases or hotspots when considered with other key chemicals of concern. Finally, the SQL/ESV ratios reflect the full SQL. When ½ SQL is considered, as is often done in risk assessments, these ratios range from 1-20. For further review of these detections, as well as the individual dilution factors associated with each chemical, refer to Tables J-2a and J-2b (Appendix J) for the Operations Area and Parcel E, respectively. Tables J-2a and J-2b are sorted by chemical in alphanumeric order and ratios sorted from highest to lowest for each chemical for easy reference. Tables J-2a and J-2b also show the ratios using ½ the SQL.

The following chemicals have SQL/ESV ratios from 50 to 500, but are not expected to have a significant contribution to risk:

Exhibit 4-16b. Constituents Not Detected with Maximum SQL/ESV Ratios 50 to 1,000 (And Frequency of Minimum SQL/ESV Ratios Greater Than 1)		
Heptachlor epoxide (91%); DF=1x-100x	Endosulfan I (56%); DF=1x-100x	Malathion (100%); DF=1x
Endosulfan sulfate (79%); DF=1x-100x	Atrazine (100%); DF=1x	2,4-Dinitrophenol (100%); DF=1x-2x
Chlordane (total) (69%); DF=1x-100x	Guthion (100%); DF=1x	3,3'-Dichlorobenzidine (85%); DF=1x-4x
Endrin aldehyde (21%) ; DF=1x-100x	Parathion (100%); DF=1x	2,4-Dimethylphenol (84%); DF=1x-2x
Hexachloroethane (85%); DF=1x-4x	2-Nitroaniline (100%); DF=1x-4x	Ethylene Glycol (100%); DF=1x

Notes: Values in parentheses indicate the percent of ratios greater than 1.
Ecological screening value (ESV); sample quantitation limit (SQL)
Dilution factors (DFs) provided indicate the range for the elevated SQL/ESV ratios exceeding 1. Ethylene glycol dilution factor not available (NA).

The chemicals identified above have SQL/ESV ratios in the 50 to 1,000 range and a high percentage of samples where SQLs exceed ESVs. The highest ratio is 500 for any chemical in this group, discussed in greater detail below. However, these chemicals were eliminated from further consideration in this OU-1 Refined SLERA, have ESVs that are based on highly conservative models versus actual toxicity testing, and spatial plots do not indicate the presence of localized releases or hotspots when considered with other key chemicals of concern. Furthermore, the ratio range (50 to 1,000) is based on full SQLs. If half of SQLs are used, the ratio range is 25 to 500. The following examples are provided based on the information provided in Tables J-2a and J-2e for the Operations Area (and note that detailed results provided in Table J-2a are sorted by chemical in alphanumeric order and ratios sorted from highest to lowest for each chemical for easy reference; detailed results in Table J-2e provide the summary of results by chemical for the Operations Area, sorted from highest to lowest ratios):

- Heptachlor epoxide had 91% of samples with an SQL exceeding an ESV, but most (more than 80%) had ratios less than or equal to 10. A total of 22 of the 126 samples (17%) from the Operations Area had SQL/ESV ratios of 50 to 500 range, with only 5 of the 126 locations (4%) with ratios exceeding 100. The 22 samples with ratios in the range of 50 to 500 had dilution factors of 5x-100x, indicating that

the elevated ratios are due in part to dilutions because of other elevated chemicals. All ratios for heptachlor epoxide reflect the influence of a low ESV for earthworms used for the evaluation. The low ESV also influenced the elevated ratios. The top two highest ratios (each 300) were from locations SSAM3-01-2BPC and RSAK4009-05.B). The spatial plot for heptachlor epoxide SQLs is provided in Figure J-2.4i.

- Endosulfan sulfate had 79% of 126 SQLs exceeding ESVs (ratios greater than 1), with the majority (approximately 85%) having ratios of 10 or less. The remaining ratios (15%) were in the range of 20 to 40, with only 1 ratio of 100 (from location RSAK4009-0.5B, with a dilution factor of 50). These ratios are also based on an earthworm ESV. The spatial plot for endosulfan sulfate SQLs is provided in Figure J-2.4e.
- Chlordane had 69% of 86 SQLs exceeding ESVs (ratios greater than 1), with the majority (approximately 83%) having ratios of 10 or less. The remaining ratios (approximately 17%) were in the range of 20 to 80, with 1 ratio of 80 (from location RSAK4009-0.5B, with a dilution factor of 50). These ratios are also based on an earthworm ESV. The spatial plot for chlordane (total) SQLs is provided in Figure J-2.4b.
- Endrin aldehyde had 21% of 126 SQLs exceeding ESVs (ratios greater than 1), with the majority (approximately 98%) of ratios 10 or less. Only two samples had elevated ratios, with ratios of 20 and 60. The ratio of 60 was from location RSAK4009-0.5B, with a dilution factor of 50. These ratios are also based on an earthworm ESV. The spatial plot for endrin aldehyde SQLs is provided in Figure J-2.4f.
- Atrazine, guthion, and malathion all had 100% of SQLs exceeding ESVs and all are based on the ESV for earthworms. None of these ratios are based on dilution factors that influenced the SQL. The spatial plots for SQLs for these three constituents are provided in Figures J-2.5a, J-2.5d, and J-2.5e for atrazine, guthion, and malathion, respectively.
- Parathion (like atrazine, guthion, and malathion) had 100% SQLs exceeding ESVs, none of the ratios are based on dilution factors. However, approximately 75% of parathion SQL/ESV ratios are 30 (i.e., less than the 50 to 500 range mentioned here), and 25% of parathion ratios are 100. All are based on the ESV for earthworms. The spatial plot for parathion SQLs is provided in Figure J-2-5f.
- 2,4-Dinitrophenol had 100% of 45 SQLs exceeding an ESV. The dilution factors were low (maximum of 2). Approximately 95% of the ratios are less than or equal to 10, with only 2 higher ratios (70 and 200) both from location RIT-3-03. Similarly, 2,4-dimethylphenol had 84% of SQLs exceeding ESVs, but most of the ratios (approximately 95%) were less than or equal to 8. The two highest ratios were 40 and 100, from locations both from RIT-3-03, diluted at a factor of 2. Finally, in this same grouping, 3,3-dichlorobenzidine also had the two highest ratios (60 and 200) from location RIT-3-03 with a dilution factor of 2. All other 3,3-dichlorobenzidine ratios (approximately 94%) were less than 20. The ratios are based on earthworm ESVs for these three constituents. The spatial plots for 2,4-dinitrophenol 2,4-dimethylphenol, and 3,3-dichlorobenzidine are provided in Figures J-2.2c, J-2.2d, and J-2.2f, respectively.

- Endrin aldehyde was analyzed 126 times, with 21% of ratios in the range of 2 to 60. Of these, only 1 SQL yielded a ratio of 60 (all others were 20 or less). All elevated ratios (2 to 20) for endrin aldehyde are based on dilution factors ranging from 2x to 100x, with the exception of one sample that was not diluted from RIT-2-05. The SQL/ESV ratio of 60 is based on a dilution factor of 50 (from sample location RSAK4009-05B). The spatial plot for endrin aldehyde SQLs is provided on Figure J-2.4f.
- Ethylene glycol was only analyzed once with a ratio of 100 based on an earthworm ESV.
- 2-Nitroaniline was analyzed in 46 samples with ratios ranging from 2 to 100 based on an earthworm ESV. Only 1 of the 46 samples had a ratio of 100, 1 other had a ratio of 40, and all others were less than or equal to 10. If ½ the SQL is used, the maximum ratio would be 50, with all other ratios being 20 or lower (with the majority being less than 4). The spatial plot for 2-nitoroaniline SQLs is provided on Figure J-2.2e.

Exhibit 4-16c provides a summary of the chemicals that have SQL/ESV ratios in the 1,000 to 10,000 range. These are the highest of the SQL/ESV ratios.

Exhibit 4-16c. Constituents Not Detected with Highest SQL/ESV Ratios for the Operations Area (Maximum Ratios 1,000 to 10,000)

Toxaphene (100%); DFs=1x-100x	Hexachlorocyclopentadiene (100%); DF=1x-4x
Benzyl alcohol (100%); DFs=1x-4x	Benzoic Acid (100%);

Notes: Values in parentheses indicate the percent of ratios greater than 1.
Ecological screening value (ESV); sample quantitation limit (SQL)
Dilution factors (DFs) provided indicate the range for the elevated SQL/ESV ratios exceeding 1.

The chemicals listed in Exhibit 4-16c cannot be definitively ruled out as potentially contributing to risk to ecological receptors within OU-1 based on very high SQL/ESV HQs and 100% of samples with SQLs exceeding ESVs. However, the chemicals listed in Exhibit 4-16c were eliminated from further consideration in this OU-1 Refined SLERA because the concentrations are below the leach-based and human health screening levels as discussed in the RI Report for OU-1 and OU-2 (Ramboll 2023b) using values from the NDEP 2023 Users Guide and Background Technical Document for NDEP BCLs for Human Health and the BMI Complex and Common Areas Revision 16 (Ramboll 2023b, NDEP 2023b). Those locations with the highest ratios are most frequently observed at locations within DU-1. For each of these chemicals, the highest density of samples with SQLs greater than ESVs and the area that contains the highest SQL/ESV HQs is the Leasehold Debris Pile. Additional information is provided in the Table J-2 series, including tabular summary of the ratios as well as spatial plots for a subset of the constituents that were not detected but had the highest ratios of SQLs and ESVs.

Collectively, these chemicals are not considered likely to pose an unacceptable risk because (1) they were not detected, (2) they do not exceed the leach-based and human health screening levels, and (3) each of these elevated ratios are based on low ESVs that are based on studies for soil dwelling organisms, as reflected by earthworm studies. For completeness, the following is provided about the chemicals listed in Exhibit 4-16c,

including the locations where the highest ratios were seen and the basis of the ESV where all ratios exceed 1:

- Toxaphene had the SQL/ESV highest ratios of any constituent, with ratios ranging from 50 to 10,000. The highest ratio (10,000) was seen at location SSAM3-01-2BPC, with second and third highest ratios (each 6,000) at locations RSAK4009-0.5B and SSAM3-013BPC. Toxaphene had 23 locations with ratios equal to or greater than 1,000. Among those, all were diluted 5x to 100x, except for one undiluted sample from RISB-11. The earthworm ESV is also low, with ratios ranging from 50 to 1000 even for samples that were not diluted. The spatial plot for toxaphene SQLs is provided on Figure J-2.4j.
- The hexachlorocyclopentadiene maximum ratios of 4,000 and 2,000 were both seen at location RIT-3-03, with a reported dilution factor of 2. The next highest ratio from any location is 500, with a dilution factor of 4. These ratios are based on an earthworm ESV. The spatial plot for hexachlorocyclopentadiene SQLs is provided on Figure J-2.2j.
- Benzoic acid and benzyl alcohol also had elevated ratios, with ratios of 400 and 1,000 for benzoic acid and ratios of 1,000 and 2,000 for benzyl alcohol from location RIT-3-03. The ESVs were based on earthworms. The spatial plots for benzoic acid and benzyl alcohol SQLs are provided on Figures J-2.2h and J-2.2i, respectively.

Patterns of elevated SQLs were often associated with elevated dilutions used for the chemical analyses, as indicated in Exhibit 4-16d below. In fact, the highest SQL/ESV ratios for 17 of 33 chemicals were found at the Leasehold debris pile. These sampling locations where SQL/ESV ratios are consistently high include the following listed in Exhibit 4-16d:

Exhibit 4-16d. Constituents Not Detected with Highest SQL/ESV Ratios for the Operations Area

Chemical Group	Sample ID	Dilutions
OCPs	SSAM3-01-2BPC, RSAK4009-0.5B	50x – 100x
OPPs	SA20-0.5D, SA11-0.5D	1x
SVOCs	RIT-3-03-20141113 (Leasehold debris pile)	2x

Notes: Ecological screening value (ESV); organochlorine pesticides (OPPs); organophosphate pesticides (OPPs); sample quantitation limit (SQL); semivolatile organic compounds (SVOCs)

Quantifying the degree of potential risk to ecological receptors from constituents with SQLs greater than ESVs is highly uncertain because these chemicals are, in fact, not detected and SQLs are not representative of actual concentration data. This uncertainty analysis provides clarity on where SQLs were elevated due to dilutions and discusses where the ESV was low and yielded elevated ratios. Finally, the spatial plots for the SQLs are provided in appendix J-2 for visualization of the areas with the highest SQL/ESV ratios. This analysis indicates that:

- The are no specific chemicals that must be further evaluated for ecological risk, despite some of the elevated ratios discussed in this section.
- The uncertainties related to samples not detected that exceed the ESVs do not change the conclusions of this risk assessment.

4.7.7 Uncertainties in the Evaluation of Criteria Based on ECOSAR

There are 26 chemicals that were not detected with SQLs that exceed the ESVs and where the source of the ESV is from USEPA Region 4 (USEPA Region 4 2018). The basis of the Region 4 ESVs for these 26 chemicals is ECOSAR and the Region 4 soil model. ECOSAR (https://www.epa.gov/tsca-screening-tools/ecological-structure-activity-relationships-ecosar-predictive-model) is a model that estimates aquatic toxicity values (for green algae, daphnids, and fathead minnows) for chemicals with no or insufficient animal testing. The relationship of chemical structure to biological activity and toxicity is called a "structure-activity relationship" (SAR). The math applied in ECOSAR uses a Quantitative Structure-Activity Relationship (QSAR) which predicts quantitative toxicological endpoints for three freshwater organisms based solely on chemical structure and water solubility. The Region 4 soil model calculates a soil criterion based on the water quality benchmark from ECOSAR, the soil f_{oc} (assumes 1% soil organic carbon), chemical characteristics, and three soil variables (water content, aeration porosity, and soil bulk density).

There are many uncertainties in this process:

- Difference between whatever aquatic organism the QSAR was based on (Region 4 does not specify and has not released the ECOSAR information for the modelled chemicals) and soil invertebrates of interest for the OU-1 Refined SLERA.
- Uncertainties in the specificity and accuracy of the ECOSAR model itself.

While the ECOSAR toxicity values are a useful place to start an investigation of chemicals where there is limited or no toxicity testing data, in general, actual measured toxicity values are less uncertain than those modelled. ECOSAR was designed to process large numbers of chemicals in relatively short timespans to prioritize further testing (Cronin et al. 2003; Sanderson 2003; de Hass et al. 2011; Hulzebos and Posthumus 2003), not for creating environmental criteria. The reason why ECOSAR is not generally used for the creation of criteria is because of the uncertainties inherent in the model. For instance, some of the structure-activity relationships are based on as few as four chemicals and have an r^2 (r^2 is an estimate of how well one variable predicts another variable, or how well ECOSAR estimated toxicity compared to measured toxicity) value of 0.7 (moderately correlated; Hulzebos and Posthumus, 2019). The USEPA (Office of Pollution Prevention and Toxics, Toxic Substances Control Act, Endocrine Disruptors Screening and Testing Advisory Committee) relies on ECOSAR to help screen chemicals to find those in need of the most urgent testing (Cronin et al. 2003), but they are not used for the federally promulgated water quality criteria (which are based on extensive biological testing). While ECOSAR is a useful tool to inform subsequent investigations, it should not be relied upon in the absence of supplemental data.

The ECOSAR model has been in a state of continuous improvement for approximately 25 years. Through the years, many studies have striven to evaluate its usefulness (Kaiser et al., 1999). The initial analysis by Kaiser et al. (1999) was as follows:

> "Our concerns with ECOSAR are threefold:
>
> (i) most of the linear correlations developed from the empirical toxicity data are statistically insignificant as they are derived from too few measured data—obvious from correlation coefficients near or at 1.0;

(ii) the statistics stated for many of the equations are highly inflated by including several measurements for the same compound as independent variables within one class of compounds—up to three times the actual number of compounds; and

(iii) the classification of compounds is inconsistent and contains elements of both a chemical nature and the compounds' use—the latter is subject to interpretation and change."

In the following decades of scientific literature, these concerns haven't changed, though the underlying data has improved (Hulzebos and Posthumus 2003; Sanderson et al. 2003; Bermúdez-Saldaña et al. 2005; Tunkel et al. 2005; Reuschenbach et al. 2008; Dom et al. 2010; de Hass et al. 2011; Barron et al. 2012; Melnikov et al. 2016; He et al. 2019; Khan et al. 2019, Massarsky et al. 2022 — see Appendix J for more details on these studies). The continuous improvement of ECOSAR is still in process (Wang et al. 2022; Xu et al. 2022; Shavalieva et al. 2022 — See Appendix J-5 for more details on these studies). The USEPA Region 4 does not provide their ECOSAR output for external review for the chemicals in their soil criteria based on ECOSAR output. The strength of the toxicity values that depend on that output is unknown and should be treated as a substantial uncertainty.

4.7.8 Uncertainties in the Evaluation of Risk to Reptiles

Potential ecotoxicological risk to reptiles is an emerging concern (Campbell and Campbell 2000; Campbell and Campbell 2002; Doering et al. 2022; Mingo et al. 2016; Sparling et al. 2010; Suter and Maciorowski 2010; Wagner et al. 2015; Weir et al. 2010; Weir et al. 2015; Weir et al. 2016). The current state of the science is limited and uncertain, as stated by the following researchers:

- "The toxicity of most chemicals to reptiles in drylands is virtually unknown" (Campbell and Campbell 2000).
- "While assessment methods are well developed for some taxa and assemblages such as fish and benthic invertebrates, there are few data and no assessment guidance for others such as amphibians, reptiles, and mollusks." (Suter and Maciorowski 2010 regarding the future of risk assessment at the USEPA)
- "Toxicity data concerning squamates [scaled reptiles] is scarce and data on effects of pesticides in species' natural habitats even more so." (Mingo et al. 2016)
- "Reptiles represent the least-studied group of vertebrates with regards to toxicology" (Doering et al. 2022).

This is due in part to the fact that the US and European Union (EU) do not require reptile testing under current laws (Doering et al, 2022; Suter and Maciorowski 2010; Wagner et al. 2015; Weir et al. 2010). While there has been an uptick in reptile ecotoxicological research over the past two decades, the number of high-quality studies is still low (Kapustka 2008).

In the absence of adequate toxicology information for reptiles, some risk assessments have used bird TRVs. However, birds are warm-blooded animals with faster metabolisms than cold-blooded reptiles (Nagy et al. 1999). This means that per kilogram BW, birds require more food intake and therefore have higher exposure to constituents of concern. Additionally, many key enzyme systems in reptiles are markedly different than birds and chemicals may react with them differently. Finally, the detoxification process may occur much more slowly in reptiles, which could change or increase toxicity.

Recent literature (Ortiz-Santaliestra et al. 2018; Weir et al. 2010; Weir et al. 2015) indicates that using bird or mammal toxicity information as surrogates for reptiles is not adequately protective of reptiles. Ortiz-Santaliestra et al. (2018) undertook a systematic review of scientific literature to compare pesticide toxicity among mammals, birds, and fish to see which organisms (if any) would serve as valid surrogates for reptiles and amphibians. They filtered the literature to find studies that used the same endpoint, exposure route, length of exposure, and type of ecotoxicological response. They found no statistically significant correlations between bird or mammal and reptile LD50s for a variety of constituents (n=11-19 constituents, depending on which subset of the data they chose). They found that reptiles were more sensitive than birds (had lower LD50s) for 5 of 15 constituents. Even applying a 10x uncertainty factor would not have made the LD50s comparable in 4 out of 15 cases. Reptile sensitivity also varied between chemical classes (i.e., pyrethroids, organophosphate insecticides, explosives) that were somewhat related to the K_{ow} of the chemical. The authors concluded that "data from terrestrial organisms provide little evidence that surrogates can effectively reflect toxicity in reptiles" (Ortiz-Santaliestra et al. 2018). Weir et al. (2010, 2015, 2016) has extensively studied ERA of reptiles. They found (Weir et al. 2010) that out of 15 chemicals that had comparable avian and reptile data, the reptiles were more sensitive to 5 of the chemicals. They suspected (Weir et al. 2015 and 2016) that this was due to reptile dermal uptake, which was likely to be a far greater contributor to exposure in reptiles than in birds.

Given the sparsity of data, lack of adequate standardized toxicity testing protocols, metabolic differences between birds and reptiles, and extensive literature reviews that indicate that birds (and mammals) are a poor surrogate for reptiles, the science to assess ecotoxicological risks to reptiles is not developed enough yet to draw conclusions regarding the potential risks to reptiles that may be exposed to chemicals within the OU-1 Refined SLERA Area.

4.7.9 Uncertainty Assessment Conclusions

The potential cumulative impacts from the presence of these constituents detected at low frequency, as shown in Table 4-12a and discussed in Section 4.7.3, and chemicals lacking ESVs (both detected and those not detected), as discussed in Section 4.7.1 and 4.7.6, were considered when present at the same location as other detected COPECs. No specific areas of elevated chemical concentrations were noticed to suggest the chemicals detected at a low frequency, or the chemicals that lack ESVs, provide a specific risk to wildlife beyond those possibilities already discussed in Sections 4.7.3, 4.7.1, and 4.7.6.

Otherwise, the uncertainties in this OU-1 Refined SLERA are similar to those observed in a typical ERA. There are uncertainties in all ERAs, but, when possible, the uncertainties include protective considerations. For most of the uncertainties described in this section, the measures overestimate versus underestimate risk. As such, the uncertainty evaluation conducted as part of this OU-1 Refined SLERA demonstrates that that the data are adequate and appropriately support the conclusions drawn in Section 5.

5. OU-1 REFINED SLERA CONCLUSIONS

The objective of this OU-1 Refined SLERA was to determine which one of the following is applicable:

1. The available data are adequate to conclude that constituents present from historical manufacturing activities do not pose an unacceptable risk to ecological receptors in the OU-1 Refined SLERA Area, and, therefore, there is no need for additional ERA (i.e., adequate information to conclude that the ecological risks are negligible, and no additional investigation of ecological risk is recommended).
2. Estimated ecological risks are not negligible, but the information is insufficient to indicate that adverse ecological effects are occurring. This may require a BERA.
3. Constituents associated with historical manufacturing activities within OU-1 have the potential to pose unacceptable ecological risks to ecological resources within the OU-1 Refined SLERA Area (i.e., there are sufficient lines of evidence to document potential or actual adverse ecological effects; recommendations may involve further investigation and/or interim action).
4. There is not adequate information to make a risk management decision due to high levels of uncertainty or incomplete information, whereupon the ERA process should continue beyond this screening-level evaluation and a plan to collect additional data should be guided by the refined SLERA.

This OU-1 Refined SLERA was performed in a manner consistent with the approved Work Plan and both USEPA and NDEP guidance. A tiered approach was used in this OU-1 Refined SLERA that includes "screening" and "refined" scenarios to evaluate the range of potential risks. The screening steps are conservative analyses designed to examine potential risks in an overly protective fashion. A refined SLERA allows for the refinement of the highly conservative assumptions using available, and often more realistic, toxicological information and parameters. The refined SLERA is conducted in a stepwise fashion starting with the "most conservative" input values and proceeding to the "most realistic" evaluation as described in Section 4.6.2. The most realistic scenario reports HQs using the most realistic values contained in the food web model. This includes the 95% UCL soil concentrations compared to LOAEL TRVs and species-specific AUFs. It is the results from the most realistic evaluation shown in the table below that should be used to make remedial decisions within the OU-1 Refined SLERA Area because these are the results that most accurately identify potential areas of risk, both spatially and by receptor.

Exhibit 5-1. Most Realistic Scenario Risk Characterization Summary Exhibit 95% UCL and LOAEL HQs Greater Than 1			
Receptor (a,b)	**Burrowing Owl**	**American Robin**	**Desert Shrew**

Manganese	Screened out in previous step, HQs <1.		
4,4'-DDE			
DDx			

Notes:

(a) Most wildlife species evaluated did not have LOAEL HQs exceeding the threshold value of 1 and therefore, no unacceptable risks are anticipated for those species (Great Basin pocket mouse, the kit fox, raccoon, mourning dove, fringed myotis, and the Cooper's hawk).

(b) The western burrowing owl, American robin, and desert shrew have relatively small home ranges and they do not use species-specific area use factors less than one.

(c) HQs less than 1 are not reported here with full precision. They are available in Appendix I.

Ecological Decision Unit (Eco DU); Hazard quotient (HQ); lowest observed adverse effects level (LOAEL); upper confidence of the mean (UCL); toxicity reference value (TRV).

Legend:	
0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10

The screening steps in this OU-1 Refined SLERA compared maximum detected concentrations in soil to highly conservative screening criteria and considered background concentrations, where applicable, as well as the frequency of detection, to focus subsequent risk analyses on only the chemicals that require further evaluation. The initial screening evaluation (Tier 1) included 300 chemicals. 171 chemicals were not detected and were therefore eliminated from further evaluation. 50 of the remaining chemicals were removed from further evaluation because the maximum HQs for these constituents were less than or equal to 1. 79 chemicals were retained for further evaluation in the Tier 2 screening. For the Operations Area, 48 chemicals were retained for the refined screening in Section 4. For Parcel E, 11 chemicals were retained for the refined screening in Section 4. Only bioaccumulative chemicals were included in the food web model which includes 20 chemicals in the Operations Area and 5 chemicals in Parcel E.

The information developed during the screening step was not adequate to make a decision for some chemicals in soil. Therefore, the risk evaluation continued to refine the COPECs identified by using more realistic estimates of exposure and considered current land use that would prohibit ecological exposure within the OU-1 Refined SLERA Area. This refined step evaluated risks for the following assessment endpoints:

- Terrestrial plant and terrestrial invertebrate community diversity, structure, and function.
- Mammal and bird population survival and reproductive ability.

Exhibit 5-1 provides a summary based on the most realistic scenario used in the OU-1 Refined SLERA and the results that most accurately identify potential areas of risk both spatially and by receptor.

5.1 Results for the Assessment of the Plant and Soil Invertebrate Community

The findings from the plant and invertebrate-specific evaluation within the OU-1 Refined SLERA Area are summarized as follows:

- The majority of chemicals detected in soil, except perchlorate and manganese, are not present at concentrations that pose an unacceptable risk to the plant and soil invertebrate community.

- Perchlorate and manganese may pose unacceptable risks to terrestrial plants and invertebrates based on RSVs and in consideration of 95% UCL LOAEL HQs.
- The potential risk to plants is most prevalent in Eco DU-1 and Eco DU-3 from exposure to perchlorate and manganese.
- The potential risk to invertebrates is most prevalent in Eco DU-1 from exposure to perchlorate and manganese and in Eco DU-3 from exposure to perchlorate.

5.2 Results for the Assessment of the Bird and Mammal Populations

The findings from the food web model for the evaluation of wildlife that may be exposed to chemical constituents within the OU-1 Refined SLERA Area are summarized as follows:

- The majority of chemicals detected in soil, except perchlorate and dioxins/furans, are not present at concentrations that pose an unacceptable risk to bird and mammal populations.
- The birds and mammals at greatest risk are the insect-eating birds and mammals, reflected by food web modeling for the desert shrew and American robin. Using the 95% UCL LOAEL HQs, potential risk to the desert shrew and American robin from exposure to perchlorate and dioxins/furans is most prevalent in Eco DU-1 and Eco DU-3. In addition, there is a potential risk to the burrowing owl from exposure to perchlorate in Eco DU-3 (HQ=3). There is a potential risk to the shrew from exposure to 4,4'-DDE in Eco DU-2 (HQ=2 only).

5.3 OU-1 Refined SLERA Conclusions

Overall, the OU-1 Refined SLERA showed that most chemicals are not present at concentrations that would pose unacceptable risks to plants, soil invertebrates, birds, and mammals[19], particularly in Eco DU-2 and Parcel E. The uncertainties associated with the OU-1 Refined SLERA are discussed in considerable detail in Section 4.7. Even given the uncertainties addressed in Section 4.7, the conclusion stated above is supported. Conclusions about risks to reptiles cannot be made as the science to assess ecotoxicological risks to reptiles is not yet developed enough to draw conclusions regarding the potential risks to reptiles that may be exposed to chemicals within the OU-1 Refined SLERA Area.

For these chemicals with HQs less than the threshold value of 1, the available data are adequate to conclude that constituents present from industrial activities do not pose an unacceptable risk to ecological receptors in the OU-1 Refined Study Area, and, therefore, there is no need for further action on the basis of ecological risk.

This OU-1 Refined SLERA demonstrated that HQs were less than 1 for many of the constituents detected, even when maximum concentrations were considered in comparison to the lowest ESVs for any ecological receptor (plants, soil invertebrates, birds, or mammals). The constituents with HQs that exceeded a value of 1 in the initial screening (maximum concentrations and lowest ESVs) were retained for the refined SLERA analyses (i.e., the refined screening), which included refined TRVs for plants, soil invertebrates, birds, and mammals. Some of the constituents retained for the Tier 2 screening had HQs less than 1. These Tier 1 and Tier 2 screenings provided adequate information to conclude that with limited exceptions discussed further below, ecological risks were negligible for

[19] Because there is no habitat at OU-1 for amphibians, there are no unacceptable exposures or risks to amphibians expected.

PAHs, SVOCs, VOCs, PCBs, radionuclides, most of the pesticides, and most of the metals. Based on NDEP guidance (NDEP 2006), no additional evaluation is needed for constituents, ecological receptors, and ecological pathways with negligible ecological risks.

The constituents with HQs exceeding a value of 1 after Step 3a included perchlorate, dioxin/furan TEQ, and several pesticides (DDE and beta-BHC). Using NDEP and USEPA guidance (USEPA 1997; NDEP 2006), each of these constituents were evaluated and discussed in terms of the bioaccumulation approach used (i.e., the food web model) and the uncertainties associated with background data, frequency of detection, derivation of the TRVs and screening values, and the interpretation of results within the context of the CSM of potential future exposures based on land use and the potential for organisms to encounter multiple chemicals in the environment of the OU-1 Refined SLERA Area. Based on these findings, the refined SLERA supports the conclusion that some potential ecological risks cannot be definitively ruled out, but no additional ERA is deemed necessary because:

- The Operations Area within the OU-1 Refined SLERA Area is a chemical manufacturing facility that will remain industrial in the future. Currently, ecological exposures are limited given the limited habitat available within OU-1.
- The food web model 95% UCL LOAEL HQs exceeded a value of 1 for the insect eating wildlife but did not exceed a value of 1 for herbivorous, omnivorous, and carnivorous birds and mammals (i.e., no unacceptable risks for the Cooper's hawk, kit fox, fringed bat, raccoon, mourning dove, and pocket mouse). Many of the 95% UCL NOAEL HQs for these wildlife were also less than 1.
- With the food web model:
    - All of the 95% UCL LOAEL HQs from the food web model are below a value of 7.
    - The 95% UCL LOAEL HQs ranged from 1 to 5 for the robin and shrew in Eco DU-1 and the 95% UCL HQs ranged from 2 to 7 for the burrowing owl, the robin, and the shrew in Eco DU-3.
    - Eco DU-2 and Parcel E did not have 95% UCL LOAEL HQs greater than 1.
    - The 95% UCL LOAEL HQs are the most appropriate to use for the OU-1 Refined SLERA Area given that OU-1 offers little ecological habitat, and the area is used for industrial purposes (i.e., the ground is compacted, and little plant cover is present so few ecological exposures will occur).
    - The food web model is considered likely to overestimate exposure and risk for the insect-eating wildlife owl, robin, and shrew. This is because the literature values used to estimate uptake via the food web are considered to be likely biased high.
- A detailed uncertainty assessment is provided, including discussion of constituents lacking ESVs and TRVs. The uncertainty analysis did not alter conclusions associated with the Refined SLERA.

Therefore, and in accordance with NDEP and USEPA guidance, the available OU-1 Refined SLERA results and data are adequate to inform risk management decisions as part of the Feasibility Study for OU-1. Further ecological risk analysis is unlikely to provide additional and/or differing information that would otherwise alter this conclusion.

TABLES

TABLE 2-1: Threatened and Endangered Species in Nevada and their Potential Occurrence in OU-1
Nevada Environmental Response Trust Site
Henderson, Nevada

Taxon	Scientific Name	Common Name	State Status (a)	Federal Status (a)	Habitat	Potential Habitat Onsite
Avian	*Empidonax traillii extimus*	Southwestern Willow Flycatcher	E	E	The southwestern willow flycatcher breeds in relatively dense riparian tree and shrub communities associated with rivers, swamps, and other wetlands including lakes and reservoirs. In most instances, the dense vegetation occurs within the first 10 to 13 feet above ground. Habitat patches must be at least 0.25 ac in size and at least 30 feet wide. Historically the southwestern willow flycatcher nested in native vegetation including willows (*Salix* spp.), seep willow (*Baccharis glutinosa*), boxelder (*Acer negundo*), buttonbush (*Cephalanthus occidentalis*), and cottonwood (*Populus* spp.). Following modern changes to riparian communities, this subspecies still nests in native vegetation, but also uses thickets dominated by non-native tamarisk and Russian olive, or in mixed native non-native stands.	No
	Coccyzus americanus	Yellow-billed Cuckoo	PT	T	A riparian species, the western yellow-billed cuckoo breeds in low- to moderate-elevation native forests lining the rivers and streams of the western United States. Cottonwood willow forests are most often used, although other riparian tree species can be important components of breeding habitat as well, such as alder (*Alnus* spp.), box elder, mesquite (*Prosopis* spp.), Arizona walnut (*Juglans major*), Arizona sycamore (*Platanus wrightii*), oak (*Quercus* spp.), netleaf hackberry (*Celtis reticulata*), velvet ash (*Fraxinus velutina*), Mexican elderberry (*Sambuccus mexicanus*), seepwillow, and occasionally, tamarisk (*Tamarix* spp.). Western yellow-billed cuckoos require relatively large (>20 hectares), contiguous patches of multilayered riparian habitat for nesting. The multilayered canopy provides shade and traps moisture to create the relatively cooler and more humid streamside conditions which are believed to be important for nesting success. They are also known to nest in early to mid-successional native riparian habitat.	No
	Rallus longirostris yumanensis	Yuma Clapper Rail	E	E	Yuma clapper rails are generally found in freshwater and alkali marshes dominated by stands of emergent vegetation interspersed with areas of open water and drier, upland benches. This subspecies prefers mature marsh stands along margins of shallow ponds with stable water levels. Nest sites selected by this subspecies are near upland areas in shallow sites dominated by mature vegetation, often in the base of a shrub. Yuma clapper rails move into different cover types in winter, showing a preference for denser cover than in summer.	No
Reptile	*Gopherus agassizii*	Desert Tortoise	T	T	The Desert Tortoise is one of most elusive inhabitants of the desert, spending up to 95% of its life underground. The desert tortoise lives in a variety of habitats from sandy flats to rocky foothills, including alluvial fans, washes and canyons where suitable soils for den construction might be found. It is found from near sea level to around 3,500 feet in elevation.	Unlikely
Fish	*Empetrichthys latos*	Pahrump Poolfish	E	E	The Pahrump poolfish is endemic to the Pahrump Valley in southern Nye County , Nevada. It is the only fish native to this valley and is one of two fish which constitute the genus *Empetrichthys.*	No

Notes:
E = Endangered
T = Threatened
OU-1 = Operable Unit 1
PT = Proposed Threatened
(a) Species of concern were identified using the United States Fish and Wildlife Information for Planning and Conservation online map-based search engine for ecological concerns within Clark County, Nevada.

TABLE 2-3: Surface Soil Ecological Screening Values
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:

(a) Ecological Soil Screening Levels (USEPA 2007): http://www.epa.gov/oswer/riskassessment/ecorisk/ecossl.htm.

(b) USEPA Region 4. 2018. "Region 4 Ecological Risk Assessment Supplemental Guidance". March. The USEPA Region 4 guidance lists ESVs for plants, soil invertebrates, mammals, and birds and uses the minimum ESV as their preferred ESV for soil screening. For some chemicals (e.g., alpha-BHC and atrazine), the preferred ESV is listed as 0.0 when there are ESVs listed for at least one receptor. For these chemicals, Ramboll assumed that the 0.0 was a mistake and used the minimum ESV listed as the preferred screening ESV.

(c) USEPA Region 6. 1999. Screening Level Ecological Risk Assessment Protocol for Hazardous Waste Combustion Facilities (EPA530-D-99-001A). August.

(d) ORNL ESVs are from Efroymson, R.A. , M.E. Will, and G.W. Suter II. 1997b. Toxicological Benchmarks for Contaminants of Potential Concern for Effects on Soil and Litter Invertebrates and Heterotrophic Process: 1997 Revision. Oak Ridge National Laboratory, Oak Ridge, TN. ES/ER/TM-126/R2. (Available at http://www.esd.ornl.gov/programs/ecorisk/documents/tm126r21.pdf)

(e) These are minimum NOAEL TRVS from Los Alamos National Laboratory EcoRisk database (Version 4.2). N3B (Newport News Nuclear BWXT-Los Alamos, LLC), November 2020. "ECORISK Database (Release 4.2)," on CD, Newport News Nuclear BWXT-Los Alamos, LLC, document EM2020-0575, Los Alamos, New Mexico. Radionuclide units are pCi/g, otherwise units are mg/kg.

(f) These values were only used if none of the preferred sources of screening values had a value.

(g) Values are selected based on the following hierarchy: Eco-SSLs; Region 4 ESVs; Region 6 ESVs; ORNL ESVs; and other criteria. Radionuclide units are pCi/g, otherwise units are mg/kg.

(h) For strontium (stable), the USEPA Region 4 guidance document lists 95 mg/kg as the mammal ESV, but 96 mg/kg is listed as the preferred ESV. The USEPA Region 4 cites the LANL EcoRisk database as the source of the ESV. Ramboll reviewed the LANL database and the ESV listed there is 95 mg/kg for mammals; as such, the 95 mg/kg ESV was used for this table.

(i) USEPA 2002: USEPA. 2002. Perchlorate Environmental Contamination: Toxicological Review and Risk Characterization. NCEA-1-0503. External Review Draft. http://oaspub.epa.gov/eims/eimscomm.getfile?p_download_id=36247.

BHC = Benzene hexachloride.
CO3 = Carbonate
DDD = Dichlorodiphenyldichloroethane.
DDE = Dichlorodiphenyldichloroethylene.
DDT = Dichlordiphenyltrichloroethane.
DDx = Sum of DDT and its isomers
DL = Detection level
Eco-SSL = Ecological soil screening levels
EFH = Extractable fuel hydrocarbons
EPN = O-Ethyl O-(4-nitrophenyl) phenylphosphonothioate
ESVs = Ecological screening values
HCO3 = Bicarbonate
HMW = High molecular weight.
Inverts = Invertebrates
LANL = Los Alamos National Laboratory
LMW = Low molecular weight.
mg/kg = Milligram per kilogram.
Min = Minimum
NC = No criteria available
NOAEL = No observed adverse effect level
OCP = Organochlorine pesticides
OPP = Organophosphate pesticides
ORNL = Oak Ridge National Laboratory
PAHs = Polycyclic aromatic hydrocarbons.
PCBs = Polychlorinated biphenyls
pCi/g = picoCuries per gram
R4 = Region 4
R6 = Region 6
RAD = Radionuclide compounds
SLERA = Screening-level ecological risk assessment.
SVOCs = Semi-volatile organic compounds
TCDD = 2,3,7,8-Tetrachlorodibenzodioxin
TEQ = Toxicity equivalancy quotient
TPH = Total petroleum hydrocarbons
TRV = Toxicity reference value
USEPA = United States Environmental Protection Agency
VOCs = Volatile organic compounds

TABLE 2-4a: Summary of OU-1 Refined SLERA Exposure Point Concentrations: Operations Area

Notes:

# = Number
BHC = Benzene hexachloride
D/F = Dioxins/furans
DDD = Dichlorodiphenyldichloroethylene
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = Sum of DDT and its isomers
DL = Detection limit
EFH = Extractable fuel hydrocarbons
EPN = O-Ethyl O-(4-nitrophenyl) phenylphosphonothioate
HMW = High molecular weight
LMW = Low molecular weight
mg/kg = Milligram per kilogram
ND = Nondetects
OCPs = Organochlorine pesticides
OPPs = Organophosphate pesticides
OU-1 = Operable Unit 1
PAHs = Polycyclic aromatic hydrocarbons
PCBs = Polychlorinated biphenyls
pci/g = Average picocuries per gram
RAD = Radionuclide compounds
SLERA = Screening level ecological risk assessment
SVOCs = Semivolatile organic compounds
TEQ = Toxic equivalency quotient
TPH = Total petroleum hydrocarbons
VOCs = Volatile organic compounds

Notes:

# = Number
BHC = Benzene hexachloride
D/F = Dioxins/furans
DDD = Dichlorodiphenyldichloroethylene
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = Sum of DDT and its isomers
DL = Detection limit
Eco DU = Ecological Decision Unit
EFH = Extractable fuel hydrocarbons
EPN = O-Ethyl O-(4-nitrophenyl) phenylphosphonothioate
HMW = High molecular weight
LMW = Low molecular weight
mg/kg = Milligram per kilogram
ND = Nondetects
OCPs = Organochlorine pesticides
OPPs = Organophosphate pesticides
OU-1 = Operable Unit 1
PAHs = Polycyclic aromatic hydrocarbons
PCBs = Polychlorinated biphenyls
pci/g = Average picocuries per gram
RAD = Radionuclide compounds
SLERA = Screening level ecological risk assessment
SVOCs = Semivolatile organic compounds
TEQ = Toxic equivalency quotient
TPH = Total petroleum hydrocarbons
VOCs = Volatile organic compounds

Notes:

# = Number
BHC = Benzene hexachloride
D/F = Dioxins/furans
DDD = Dichlorodiphenyldichloroethylene
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = Sum of DDT and its isomers
DL = Detection limit
Eco DU = Ecological Decision Unit
EFH = Extractable fuel hydrocarbons
EPN = O-Ethyl O-(4-nitrophenyl) phenylphosphonothioate
HMW = High molecular weight
LMW = Low molecular weight
mg/kg = Milligram per kilogram
ND = Nondetects
OCPs = Organochlorine pesticides
OPPs = Organophosphate pesticides
OU-1 = Operable Unit 1
PAHs = Polycyclic aromatic hydrocarbons
PCBs = Polychlorinated biphenyls
pci/g = Average picocuries per gram
RAD = Radionuclide compounds
SLERA = Screening level ecological risk assessment
SVOCs = Semivolatile organic compounds
TEQ = Toxic equivalency quotient
TPH = Total petroleum hydrocarbons
VOCs = Volatile organic compounds

Chemical Group	Chemical Name	Units	# Samples	# Detects	Minimum Detection	Average (ND = 0.5DL)	Maximum Detection
VOCs	Vinyl acetate	mg/kg	2	0	ND	9.25E-05	ND
VOCs	Vinyl chloride	mg/kg	9	0	ND	1.06E-03	ND
VOCs	Xylenes (total)	mg/kg	5	0	ND	3.58E-03	ND

Notes:

# = Number
BHC = Benzene hexachloride
D/F = Dioxins/furans
DDD = Dichlorodiphenyldichloroethylene
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = Sum of DDT and its isomers
DL = Detection limit
Eco DU = Ecological Decision Unit
EFH = Extractable fuel hydrocarbons
EPN = O-Ethyl O-(4-nitrophenyl) phenylphosphonothioate
HMW = High molecular weight
LMW = Low molecular weight
mg/kg = Milligram per kilogram
ND = Nondetects
OCPs = Organochlorine pesticides
OPPs = Organophosphate pesticides
OU-1 = Operable Unit 1
PAHs = Polycyclic aromatic hydrocarbons
PCBs = Polychlorinated biphenyls
pci/g = Average picocuries per gram
RAD = Radionuclide compounds
SLERA = Screening level ecological risk assessment
SVOCs = Semivolatile organic compounds
TEQ = Toxic equivalency quotient
TPH = Total petroleum hydrocarbons
VOCs = Volatile organic compounds

Notes:

# = Number
BHC = Benzene hexachloride
D/F = Dioxins/furans
DDD = Dichlorodiphenyldichloroethylene
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = Sum of DDT and its isomers
DL = Detection limit
EFH = Extractable fuel hydrocarbons
EPN = O-Ethyl O-(4-nitrophenyl) phenylphosphonothioate
HMW = High molecular weight
LMW = Low molecular weight
mg/kg = Milligram per kilogram
ND = Nondetects
OCPs = Organochlorine pesticides
OPPs = Organophosphate pesticides
OU-1 = Operable Unit 1
PAHs = Polycyclic aromatic hydrocarbons
PCBs = Polychlorinated biphenyls
pci/g = Average picocuries per gram
RAD = Radionuclide compounds
SLERA = Screening level ecological risk assessment
SVOCs = Semivolatile organic compounds
TEQ = Toxic equivalency quotient
TPH = Total petroleum hydrocarbons
VOCs = Volatile organic compounds

TABLE 3-1a: Screening-Level Evaluation of Chemicals: Operations Area
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:

(a) Background screening only applicable to metals and radionuclides (NDEP 2009c). Constituents marked as having a low detect frequency (LDF) in either the site or background datasets were visually evaluted using Quantile-Quantile (Q-Q) plots and boxplots. See Appendix E for details of background screening.

= Number
% = Percent
BHC = Benzene hexachloride
D/F = Dioxins/furans
DDD = Dichlorodiphenyldichloroethylene
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = Sum of DDT and its isomers
Det = Detected
DL = Detection limit
Eco-SSL = Ecological soil screening level
EFH = Extractable fuel hydrocarbons
EPN = O-Ethyl O-(4-nitrophenyl) phenylphosphonothioate
ESV = Ecological screening value
FOD = Frequency of detection
HMW = High molecular weight
HQ = Hazard quotient
Inverts = Invertebrates
LANL = Los Alamos National Laboratory
LDF = Low detection frequency
LMW = Low molecular weight
MAX = Maximum
mg/kg = Milligram per kilogram
Min = Minimum
NA = Not applicable
NC = No criteria
ND = Nondetects
NOAEL = No observed adverse effect level
OCPs = Organochlorine pesticides
OPPs = Organophosphate pesticides
ORNL = Oak Ridge National Laboratory (ORNL 1997)
OU-1 = Operable Unit 1
PAHs = Polycyclic aromatic hydrocarbons
PCBs = Polychlorinated biphenyls
pci/g = Average picocuries per gram
R4 = Region 4 (USEPA 2018)
R6 = Region 6 (USEPA 1999)
RAD = Radionuclide compounds
SLERA = Screening level ecological risk assessment
SQL = Sample quantitation limit
SVOCs = Semivolatile organic compounds
TEQ = Toxic equivalency quotient
TPH = Total petroleum hydrocarbons
TRV = Toxicity reference value
USEPA = United States Environmental Protection Agency
VOCs = Volatile organic compounds

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100
1,000	100 < HQ

TABLE 3-1b: Screening-Level Evaluation of Chemicals: Parcel E
Nevada Environmental Response Trust Site
Henderson, Nevada

(a) Background screening only applicable to metals and radionuclides (NDEP 2009c). Constituents marked as having a low detect frequency (LDF) in either the site or background datasets were visually evaluted using Quantile-Quantile (Q-Q) plots and boxplots. See Appendix E for details of background screening.

Notes:

= Number
% = Percent
BHC = Benzene hexachloride
D/F = Dioxins/furans
DDD = Dichlorodiphenyldichloroethylene
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = Sum of DDT and its isomers
Det = Detected
DL = Detection limit
Eco-SSL = Ecological soil screening level
EFH = Extractable fuel hydrocarbons
EPN = O-Ethyl O-(4-nitrophenyl) phenylphosphonothioate
ESV = Ecological screening value
FOD = Frequency of detection
HMW = High molecular weight
HQ = Hazard quotient
Inverts = Invertebrates
LANL = Los Alamos National Laboratory
LDF = Low detection frequency
LMW = Low molecular weight
MAX = Maximum
mg/kg = Milligram per kilogram
Min = Minimum
NA = Not applicable
NC = No criteria
ND = Nondetects
NOAEL = No observed adverse effect level
OCPs = Organochlorine pesticides
OPPs = Organophosphate pesticides
ORNL = Oak Ridge National Laboratory (ORNL 1997)
OU-1 = Operable Unit 1
PAHs = Polycyclic aromatic hydrocarbons
PCBs = Polychlorinated biphenyls
pci/g = Average picocuries per gram
R4 = Region 4 (USEPA 2018)
R6 = Region 6 (USEPA 1999)
RAD = Radionuclide compounds
SLERA = Screening level ecological risk assessment
SQL = Sample quantitation limit
SVOCs = Semivolatile organic compounds
TEQ = Toxic equivalency quotient
TPH = Total petroleum hydrocarbons
TRV = Toxicity reference value
USEPA = United States Environmental Protection Agency
VOCs = Volatile organic compounds

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100
1,000	100 < HQ

TABLE 3-2b: Screening-Level Evaluation of Chemicals: Eco DU-2
Nevada Environmental Response Trust Site
Henderson, Nevada

(a) Background screening only applicable to metals and radionuclides (NDEP 2009c). Constituents marked as having a low detect frequency (LDF) in either the site or background datasets were visually evaluted using Quantile-Quantile (Q-Q) plots and boxplots. See Appendix E for details of background screening.

Notes:

= Number
% = Percent
BHC = Benzene hexachloride
D/F = Dioxins/furans
DDD = Dichlorodiphenyldichloroethylene
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = Sum of DDT and its isomers
Det = Detected
DL = Detection limit
Eco-SSL = Ecological soil screening level
EFH = Extractable fuel hydrocarbons
EPN = O-Ethyl O-(4-nitrophenyl) phenylphosphonothioate
ESV = Ecological screening value
FOD = Frequency of detection
HMW = High molecular weight
HQ = Hazard quotient
Inverts = Invertebrates
LANL = Los Alamos National Laboratory
LDF = Low detection frequency
LMW = Low molecular weight
MAX = Maximum
mg/kg = Milligram per kilogram
Min = Minimum
NA = Not applicable
NC = No criteria
ND = Nondetects
NOAEL = No observed adverse effect level
OCPs = Organochlorine pesticides
OPPs = Organophosphate pesticides
ORNL = Oak Ridge National Laboratory (ORNL 1997)
OU-1 = Operable Unit 1
PAHs = Polycyclic aromatic hydrocarbons
PCBs = Polychlorinated biphenyls
pci/g = Average picocuries per gram
R4 = Region 4 (USEPA 2018)
R6 = Region 6 (USEPA 1999)
RAD = Radionuclide compounds
SLERA = Screening level ecological risk assessment
SQL = Sample quantitation limit
SVOCs = Semivolatile organic compounds
TEQ = Toxic equivalency quotient
TPH = Total petroleum hydrocarbons
TRV = Toxicity reference value
USEPA = United States Environmental Protection Agency
VOCs = Volatile organic compounds

TABLE 3-2c: Screening-Level Evaluation of Chemicals: Eco DU-3
Nevada Environmental Response Trust Site
Henderson, Nevada

(a) Background screening only applicable to metals and radionuclides (NDEP 2009c). Constituents marked as having a low detect frequency (LDF) in either the site or background datasets were visually evaluted using Quantile-Quantile (Q-Q) plots and boxplots. See Appendix E for details of background screening.

Notes:

= Number
% = Percent
BHC = Benzene hexachloride
D/F = Dioxins/furans
DDD = Dichlorodiphenyldichloroethylene
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = Sum of DDT and its isomers
Det = Detected
DL = Detection limit
Eco-SSL = Ecological soil screening level
EFH = Extractable fuel hydrocarbons
EPN = O-Ethyl O-(4-nitrophenyl) phenylphosphonothioate
ESV = Ecological screening value
FOD = Frequency of detection
HMW = High molecular weight
HQ = Hazard quotient
Inverts = Invertebrates
LANL = Los Alamos National Laboratory
LDF = Low detection frequency
LMW = Low molecular weight
MAX = Maximum
mg/kg = Milligram per kilogram
Min = Minimum
NA = Not applicable
NC = No criteria
ND = Nondetects
NOAEL = No observed adverse effect level
OCPs = Organochlorine pesticides
OPPs = Organophosphate pesticides
ORNL = Oak Ridge National Laboratory (ORNL 1997)
OU-1 = Operable Unit 1
PAHs = Polycyclic aromatic hydrocarbons
PCBs = Polychlorinated biphenyls
pci/g = Average picocuries per gram
R4 = Region 4 (USEPA 2018)
R6 = Region 6 (USEPA 1999)
RAD = Radionuclide compounds
SLERA = Screening level ecological risk assessment
SQL = Sample quantitation limit
SVOCs = Semivolatile organic compounds
TEQ = Toxic equivalency quotient
TPH = Total petroleum hydrocarbons
TRV = Toxicity reference value
USEPA = United States Environmental Protection Agency
VOCs = Volatile organic compounds

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100
1,000	100 < HQ

(a) Neptune provided Ramboll with a copy of the R codes used for the UCL calculation on May 18, 2020. The higher UCL value generated between the bias-corrected accelerated bootstrap method (BCa UCL) and the Student's t-test method was selected. If the calculated UCL's were greater than the maximum detect, then the max was used as a surrogate.

(b) UCLs calculated using the BCa Bootstrap method were selected for all constituents, except for bromodichloromethane, chloromethane, formaldehyde, and ethyl tert-butyl ether, which were set equal to the max detect.

Notes:

% = Percent
BHC = Benzene hexachloride
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = Sum of DDT and its isomers
DL = Detection limit
Eco-SSL = Ecological soil screening level
EFH = Extractable fuel hydrocarbons
ESV = Ecological screening value
FWM = Foodweb model
HQ = Hazard quotient
Inverts = Invertebrates
LANL = Los Alamos National Laboratory
mg/kg = milligram(s) per kilogram
ND = not detected
NOAEL = No observed adverse effect level
OCPs = Organochlorine pesticides
ORNL = Oak Ridge National Laboratory (ORNL 1997)
PAH = Polycyclic aromatic hydrocarbon
PCBs = Polychlorinated biphenyls
R4 = Region 4 (USEPA 2018)
SLERA = Screening level ecological risk assessment
SQL = Sample Quantitation Limit
SVOCs = Semivolatile organic compounds
TEQ = Toxic equivalency quotient
TPH = Total petroleum hydrocarbons
TRV = Toxicity reference value
95% UCL= 95 percent upper confidence level of the mean
VOCs = Volatile organic compounds

0.5	HQ<1
1	HQ = 1
10	1< HQ ≤10
100	10 < HQ ≤ 100
1,000	100 < HQ

(a) Neptune provided Ramboll with a copy of the R codes used for the UCL calculation on May 18, 2020. The higher UCL value generated between the bias-corrected accelerated bootstrap method (BCa UCL) and the Student's t-test method was selected. If the calculated UCL's were greater than the maximum detect, then the max was used as a surrogate.

(b) UCLs calculated using the BCa Bootstrap method were selected for all constituents, except for: 1) vanadium, which is the tUCL and 2) bromodichloromethane, 2-chlorophenol, ethyl tert-butyl ether, formaldehyde and octachlorostyrene, which were set equal to the max detect.

Notes:

% = Percent
BHC = Benzene hexachloride
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = Sum of DDT and its isomers
DL = Detection limit
Eco-SSL = Ecological soil screening level
EFH = Extractable fuel hydrocarbons
ESV = Ecological screening value
FWM = Foodweb model
HQ = Hazard quotient
Inverts = Invertebrates
LANL = Los Alamos National Laboratory
mg/kg = milligram(s) per kilogram

Henderson, Nevada

(a) Neptune provided Ramboll with a copy of the R codes used for the UCL calculation on May 18, 2020. The higher UCL value generated between the bias-corrected accelerated bootstrap method (BCa UCL) and the Student's t-test method was selected. If the calculated UCL's were greater than the maximum detect, then the max was used as a surrogate.

(b) UCLs calculated using the BCa Bootstrap method were selected for all constituents, except for 1) ammonia, nitrite, ortho-Phosphate, 4,4'-DDE, 4,4'-DDT, and DDx, which used the tUCL, and 2) Sulfur, which was set equal to the max detect.

Notes:

(a) Neptune provided Ramboll with a copy of the R codes used for the UCL calculation on May 18, 2020. The higher UCL value generated between the bias-corrected accelerated bootstrap method (BCa UCL) and the Student's t-test method was selected. If the calculated UCL's were greater than the maximum detect, then the max was used as a surrogate.

(b) Formaldehyde UCL set equivalent to maximum detection because the UCL was greater than the max.

Notes:

(a) Values are selected based on the following hierarchy: Eco-SSL, Region 4 ESV, Region 6 ESV, ORNL ESV, LANL, and other criteria.
(b) Invertebrate ESV is from the USEPA 2007 DDx Eco-SSL (USEPA 2007) and is the geomean of 5 studies from Table 4.1, which had organic matter from 0 to 2% and a bioavailability score of 1, divided by a factor of 10 to reflect an acute to chronic value.
(c) There is a scarcity of literature availabe on vanadium toxicity for soil invertebrates. Environment Canada reported a vanadium pentoxide No Observed Effect Concentration of 210 mg/kg on earthworms in artificial soil. This value was used in the invertebrate screening.

BHC = Benzene hexachloride
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlordiphenyltrichloroethane
DDx = Sum of all DDT isomers and metabolites
DL = Detection level
Eco-SSL = Ecological soil screening levels (USEPA 2007)
EFH = Extractable fuel hydrocarbons
ESV = Ecological screening value
Invert = Invertebrate
LANL = Los Alamos National Laboratory
mg/kg = Milligram per kilogram
NC = No criteria available
ND = Not detected
NOAEL = No observed adverse effect level
OCPs = Organochlorine pesticides
ORNL = Oak Ridge National Laboratory (ORNL 1997)
PCBs = Polychlorinated biphenyls
Region 4 = USEPA Region 4 (2018)
SLERA = Screening level ecological risk assessment
SVOCs = Semivolatile organic compounds
TPH = Total petroleum hydrocarbons
TRV = Toxicity reference value
USEPA = United States Environmental Protection Agency
VOCs = Volatile organic compounds

TABLE 4-5a: Potential Risks to Terrestrial Plants from Soil: Operations Area
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:

Efforts were made to identify ecological benchmarks specific to plants. When specific plant ecological benchmarks are not available, the chemical was not screened but treated as an uncertainty.

(a) The LANL database contains both LOAEL and NOAEL TRVs, which are used for ESVs and RSVs, respectively. The NOAEL TRV (ESV) provides an initial screening step to characterize risks while the LOAEL TRV (RSV) provides a more realistic look at the risk. For perchlorate beta-BHC, and EFH (C10-C40), soil concentrations were compared to both ESVs and RSVs. For boron, the Region 4 ESV and the LANL RSV were used for comparison.

(b) The ESV is from the Eco-SSL (Eco-SSL 2007). The toxicity value (707 mg/kg) for the less-sensitive plant species (i.e., cotton and nile grass), as provided in the USEPA (2007) Eco-SSL derivation for terrestrial plants, is used as the RSV to further to characterize risk to terrestrial plants.

TABLE 4-5c: Potential Risks to Terrestrial Plants from Soil: Eco DU-2
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:
Efforts were made to identify ecological benchmarks specific to plants. When specific plant ecological benchmarks are not available, the chemical was not screened but treated as an uncertainty.
(a) The LANL database contains both LOAEL and NOAEL TRVs, which are used for ESVs and RSVs, respectively. The NOAEL TRV (ESV) provides an initial screening step to characterize risk while the LOAEL TRV (RSV) provides a more realistic look at the risk. For perchlorate and beta-BHC, soil concentrations were compared to both ESVs and RSVs. For boron, the Region 4 ESV and the LANL RSV were used for comparison.

TABLE 4-6a: Potential Risks to Terrestrial Invertebrates from Soil: Operations Area
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:
Efforts were made to identify ecological benchmarks specific to invertebrates. When specific invertebrate ecological benchmarks are not available, the chemical was not screened but treated as an uncertainty.
(a) The LANL database contains both NOAEL and LOAEL TRVs, which are used for ESVs and RSVs, respectively. The NOAEL TRV provides an initial screening step to characterize risk to invertebrates with the LOAEL TRV providing a more realistic look at the risk to invertebrates. For perchlorate and EFH (C10-C40), soil concentrations were compared to both ESVs and RSVs.

(b) The ESV is from the Eco-SSL (Eco-SSL 2007). A study by Phillips et al. (2002), as cited in USEPA (2007), provides a toxicity value of 1,209 mg/kg for springtails, a soil invertebrate, and is used as the RSV to characterize risk to terrestrial invertebrates in this table.

(c) The ESV is from the Eco-SSL (Eco-SSL 2007) and is the geomean of 5 studies from Table 4.1 with organic matter from 0 to 2% and a bioavailability score of 1, divided by a factor of 10 to reflect an acute to chronic value. The RSV is also from this document and is the geomean of 5 studies from Table 4.1 with organic matter from 0 to 2% and a bioavailability score of 1, reflecting the acute LC50 value.

(d) The beta-BHC ESV is from USEPA Region 4 (2018). The BHC RSV is from Novais et al. (2010) which reported a gamma-BHC reproductive No Observed Adverse Effect Level (NOEL) of 18 mg/kg and a mortality NOAEL of 5.6 mg/kg after a 42-day exposure to the potworm (soil invertebrate). The lower mortality endpoint is used in this table as an RSV for exposure of beta-BHC to soil invertebrates.

TABLE 4-6c: Potential Risks to Terrestrial Invertebrates from Soil: Eco DU-2
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:
Efforts were made to identify ecological benchmarks specific to plants. When specific plant ecological benchmarks are not available, the chemical was not screened but treated as an uncertainty.
(a) The LANL database contains both NOAEL and LOAEL TRVs, which are used for ESVs and RSVs, respectively. The NOAEL TRV provides an initial screening step to characterize risk to invertebrates with the LOAEL TRV providing a more realistic look at the risk to invertebrates. For perchlorate, soil concentrations were compared to both ESVs and RSVs.
(b) The ESV is from the Eco-SSL (Eco-SSL 2007) and is the geomean of 5 studies from Table 4.1 with organic matter from 0 to 2% and a bioavailability score of 1, divided by a factor of 10 to reflect an acute to chronic value. The RSV is also from this document and is the geomean of 5 studies from Table 4.1 with organic matter from 0 to 2% and a bioavailability score of 1, reflecting the acute LC50 value.
(c) The beta-BHC ESV is from USEPA Region 4 (2018). The BHC RSV is from Novais et al. (2010) which reported a gamma-BHC reproductive No Observed Adverse Effect Level (NOEL) of 18 mg/kg and a mortality NOAEL of 5.6 mg/kg after a 42-day exposure to the potworm (soil invertebrate). The lower mortality endpoint is used in this table as an RSV for exposure of beta-BHC to soil invertebrates.

Notes:
Efforts were made to identify ecological benchmarks specific to plants. When specific plant ecological benchmarks are not available, the chemical was not screened but treated as an uncertainty.
(a) The LANL database contains both NOAEL and LOAEL TRVs, which are used for ESVs and RSVs, respectively. The NOAEL TRV provides an initial screening step to characterize risk to invertebrates with the LOAEL TRV providing a more realistic look at the risk to invertebrates. For perchlorate, soil concentrations were compared to both ESVs and RSVs.
(b) The ESV is from the Eco-SSL (Eco-SSL 2007) and is the geomean of 5 studies from Table 4.1 with organic matter from 0 to 2% and a bioavailability score of 1, divided by a factor of 10 to reflect an acute to chronic value. The RSV is also from this document and is the geomean of 5 studies from Table 4.1 with organic matter from 0 to 2% and a bioavailability score of 1, reflecting the acute LC50 value.
(c) The beta-BHC ESV is from USEPA Region 4 (2018). The BHC RSV is from Novais et al. (2010) which reported a gamma-BHC reproductive No Observed Adverse Effect Level (NOEL) of 18 mg/kg and a mortality NOAEL of 5.6 mg/kg after a 42-day exposure to the potworm (soil invertebrate). The lower mortality endpoint is used in this table as an RSV for exposure of beta-BHC to soil invertebrates.

Notes:

BHC = Benzene hexachloride
D/F = Dioxin/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = Sum of all DDT isomers and metabolites
DL = Detection limit
LOAEL = Lowest observed adverse effects level
mg/kg-bw/day = Milligrams per kilogram body weight per day
NA = Not applicable
NC = No criterion
ND = Non-detected concentrations
NOAEL = No observed adverse effects level
OCPs = Organochlorine pesticides
PCBs = Polychlorinated biphenyls
R6 = Region 6
SVOCs = Semivolatile organic compounds
TEQ = Toxic equivalent quotient
TRV = Toxicity reference value
TSRF = Tittabawassee & Saginaw River & Floodplain
USACHPPM = United States Army Center for Health Promotion and Preventative Medicine
USEPA = United States Environmental Protection Agency

(a) USEPA R6: USEPA Region 6. 1999. Screening Level Ecological Risk Assessment Protocol for Hazardous Waste Combustion Facilities. Volume One (EPA530-D-99-001A). August. Appendix E.
(b) Eco-SSL: USEPA. 2007. Guidance for Developing Ecological Soil Screening Levels (Directive 9285.7-55) Eco-SSL Guidance. Washington, D.C.: USEPA, Office of Solid Waste and Emergency Response. April.
(c) Sample, B.E., D.M. Opresko, and G.W. Suter II. 1996. Toxicological Benchmarks for Wildlife: 1996 Revision (ES/ER/TM-86/R3). Oak Ridge, Tennessee: Risk Assessment Program, Health Sciences Research Division. June.
(d) USACHPPM 2007 Wildlife Toxicity Assessment for Perchlorate. Tables 6 and 7. http://usaphcapps.amedd.army.mil/erawg/tox/files/WTAPerchlorate(Final)07v2.pdf
(e) This TRV is a geometric mean of several Aroclor studies. See the subsequent table for additional documentation.
(f) Ramboll calculated TRV. See text for more details regarding the calculation.

1 If the NOAEL was not reported, it is assumed to be 1/10 of the LOAEL. If the LOAEL is not reported, it is assumed to be 10x the NOAEL.
2 As the Eco-SSL does not present a LOAEL, the LOAEL is calculated as the geomean of the survival, growth, and reproduction LOAELs from the survival, growth, and reproduction studies that was used for the Eco-SSL NOAEL.
3 TRV for DDT used as a surrogate.
4 Same study as NOAEL from Eco-SSL.
5 BHC mixed isomers used as a surrogate for birds.
6 TRV for dioxin/furan TEQ used as a surrogate.
7 The TRV is the average of available values for the category "Other Chlorinated Organics" in USEPA R6. For birds, it is the average of hexachlorobenzene, hexachlorobutadiene, and pentachlorophenol. For mammals, it is the average of hexachlorabenzene, hexaclorobutadiene, hexachlorocyclopentadiene, pentachlorobenzene, and pentachlorophenol.

Aroclor 1254	Mouse	Oral	--	1.4	3.4	Voltura and French 2007	
			Geometric Mean	**0.26**	**1.27**		
Birds							
Aroclor 1248	Screech Owl	Oral	360	0.41	NR	McLane and Hughes 1980	Sample et al. 1996
Aroclor 1254	Mallard	Oral	30	8.1	NR	Custer and Heinz 1980	
Aroclor 1254	Pheasants	Oral	112	0.18	1.8	Dahlgren et al. 1972	Sample et al. 1996
Aroclor 1254	Mourning Dove	Oral	42	NR	2.6	Tori and Peterle 1983	
Aroclor 1254	American Kestrel	Oral	100	NR	7	Fernie et al. 2001a,b	
Aroclor 1254	Robins	Oral	Breeding Season	7.8	NR	Henning et al. 2003	
			Geometric Mean	**1.47**	**3.20**		

Notes:

LOAEL = Lowest observed adverse effects level
mg/kg bw-day = Milligrams per kilogram of body weight per day
NOAEL = No observed adverse effects level
PCB = Polychlorinated biophenyl
NR = Not reported
TRV = Toxicity reference value

Notes:

AUF = Area use factor
BHC = Benzene hexachloride
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = Sum of all DDT isomers and metabolites
DL = Detection limit
HQ = Hazard quotient
LOAEL = Lowest observed adverse effect level
MAX = Maximum

NA = Not applicable
NC = No criterion
ND = Nondetects
NOAEL = No observed adverse effect level
OCPs = Organochlorine pesticides
PCBs = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient

0.1	HQ<1
1	HQ = 1
5	1< HQ <10
50	10 < HQ ≤ 100
100	100 < HQ

Notes:

% = Percent
AUF = Area use factor
AVG = Average
BHC = Benzene hexachloride
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = Sum of all DDT isomers and metabolites
DL = Detection limit
HQ = Hazard quotient
LOAEL = Lowest observed adverse effect level
NA = Not applicable
NC = No criterion
ND = Nondetects
NOAEL = No observed adverse effect level
OCPs = Organochlorine pesticides
PCBs = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference values
UCL = 95% upper confidence level

0.1	HQ<1
1	HQ = 1
5	1< HQ <10
50	10 < HQ ≤ 100

Notes:

% = Percent
AUF = Area use factor
AVG = Average
BHC = Benzene hexachloride
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = Sum of all DDT isomers and metabolites
DL = Detection limit
HQ = Hazard quotient
LOAEL = Lowest observed adverse effect level
NA = Not applicable
NC = No criterion
ND = Nondetects
NOAEL = No observed adverse effect level
OCPs = Organochlorine pesticides
PCBs = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference values
UCL = 95% upper confidence level

0.1	HQ<1
1	HQ = 1
5	1< HQ <10
50	10 < HQ ≤ 100

Notes:

% = Percent
AUF = Area use factor
AVG = Average
BHC = Benzene hexachloride
D/F = Dioxins/furans
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
DDx = Sum of all DDT isomers and metabolites
DL = Detection limit
HQ = Hazard quotient
LOAEL = Lowest observed adverse effect level
NA = Not applicable
NC = No criterion
ND = Nondetects
NOAEL = No observed adverse effect level
OCPs = Organochlorine pesticides
PCBs = Polychlorinated biphenyls
SVOCs = Semivolatile organic compounds
TEQ = Toxicity equivalent quotient
TRV = Toxicity reference values
UCL = 95% upper confidence level

0.1	HQ<1
1	HQ = 1
5	1< HQ <10
50	10 < HQ ≤ 100

TABLE 4-11: Effects of Uncertainty in Ecological Risk Assessment
Nevada Environmental Response Trust Site
Henderson, Nevada

Source of Uncertainty	SLERA Management Approach	Effects on Risk Estimation
Uncertainties in Hazard Identification		
Receptor Populations	How many organisms are at risk, given the size and characterization of the site? Given the expansive hardscape left on the site, and the human disturbance, parts of OU-1 are not likely to have biologically significant populations of animal receptors. If that is the case, ecological risk assessment may have trivial input to site management.	Likely causes overestimation of risk because of probable absence of biologically significant populations of receptors.
Receptor Demographics	Which organisms are at risk, given the size and characterization of the site? There were no formal biological surveys of plants, no insect community collections, no trapping studies of small animals, no birdwatching studies by trained ornithologists, and no survey of larger animals in OU-1. The list of receptors used in the risk assessment may not match the receptors in OU-1.	Unknown.
Evaluation of Reptiles	Ecological risk assessment for reptiles has been a particular focus of scientific interest for at least two decades. Despite that, there is a dearth of standardized test methods, the toxicity data is patchy-to-nonexistent, and there are no widely accepted receptor parameters. This is largely because both the US and EU do not require reptile testing as part of their environmental regulations. The hot, arid environment of OU-1 is likely to contain a diversity of lizards and several kinds of snakes that are not quantiatively assessed.	Likely causes underestimation of risk as reptiles are not assessed quantitatively.
Choice of Assessment Endpoints	Assessment endpoints were chosen for OU-1 based on the best understanding of which receptors might be rare species or ecologically important "keystone" species who's presence (or absence) can change the ecological community. For instance, do plants in OU-1 hold down the soil and are therefore the keystone species? Which plants? However, there has been no formal analysis of ecosystem functions or services in OU-1 to verify this understanding.	Unknown.
Exposure Pathways & Conceptual Site Model	The exposure pathways - and the identification of complete exposure pathways - at OU-1 was based on professional experience of trained ecologists, site personel, and local government. However, there has been no tracer analysis to verify which exposure pathways are complete. If the conceptual site model is incorrect, the risk assessment might be assessing incomplete pathways, or missing complete pathways.	Unknown.
Additional Stressors	The receptors in OU-1 are assessed for their vulnerabiliy to chemical stressors, however, there are many other stressors at OU-1 that may affect populations of receptors. For instance, there could be an outbreak of scarcoptic mange in local coyotes that renders them especially vulnerable to chemicals that may interact with the dermal pathway. Climate change and increased temperatures could mean that prey mammals are heat stressed. Human disturbance may cause animals to flee out of their preferred microhabitats. This risk assessment does not take into effect any stressors other than chemical.	Likely causes an underestimation of risk because plants and animals under stress are more sensitive.
Uncertainties in the Exposure Assessment - Chemical Data		
Limited Number of Samples	The sampling within the OU-1 Refined SLERA Study Area is generally robust. The ecological risk assessment for soil uses a limited set of samples that only included the top two feet of soil because there is far more biological activity there than at deeper depths. There are only a few chemicals with limited sampling locations and these are chemicals that are not risk drivers. As such, limited number of samples is not considered an issue at OU-1.	Unknown.
Assumed Bioavailability is 100%	The chemicals detected in OU-1 are assumed to be 100% bioavailable and this is not true. Most aluminum in the Earth's upper crust is aluminum oxide - a very stable mineral. Iron and manganese oxides are also relatively stable, ubiquitous minerals. These minerals are often bound in rocks and gravel - but the chemical analysis dissolves them in strong acids to get the total values of the metals. The organisms in OU-1 cannot eat rocks and are not exposed to the minerals bound up in them. While some birds may use grit in their gizzard to help macerate food, the grit is not exposed to strong acids as they are in laboratory analysis and do not completely break down. Organic and hydrophobic chemicals are likely bound to clay or organic particles in the soil. In laboratory testing they are extracted with solvents.	Likely causes a significant overestimation of risk from chemicals in OU-1.
Biased Sampling	The sampling within the OU-1 Refined SLERA Study Area is generally robust and well-distributed, but was designed to help identify areas with higher concentrations of toxic chemicals in order to guide site delineation and site cleanup. Relatively few samples were taken in areas where site activities were unlikely to have caused chemical contamination, and relatively more samples were taken in areas that were likely to be contaminated. This biases the sample concentrations high.	Likely causes an overestimation of risk.
Chemicals That Are Not Detected	Many chemicals were not detected in OU-1. Some of these chemicals might be present in OU-1 at concentrations below the detection limits and may still have ecological effects that can not be quantified in this risk assesment.	Unknown.
Use of Maximum or 95% UCL Concentrations	Using 95 percent upper confidence limits and maximum detected concentrations is likely to overestimate intakes since most exposure is at lower concentrations. Constituents in OU-1 generally have a few locations with high concentrations and many locations with very low concentrations (see Figures 4-13, 4-14, and 4-15 for distributions of concentrations of perchlorate, mammal and avian dioxin/furan TEQs, and manganese). Using the maximum value vastly overestimates risk. Even the 95% upper confidence level of the mean overestimates the actual mean of concentrations.	Likely causes a significant overestimation of risk from chemicals in OU-1.

Source of Uncertainty	SLERA Management Approach	Effects on Risk Estimation
Uncertainties in the Exposure Assessment - Biological Data		
Dermal and Inhalation Pathways Not Assesed	Ecological risk assessment does not generally include the dermal and inhalation pathways. The uptake values are very poorly understood and documented and the toxicity via these pathways is largely unstudied. However, at OU-1, the aeolian dust may be a complete - and important - uptake pathway. Give the arid conditions of OU-1, most creatures have an external covering that is largely waterproof to reduce fluid loss, so uptake from the dermal pathway might be trivial.	Unknown.
Which Chemicals Bioaccumulate	For OU-1, bioaccumulative chemicals were determined by the existence of a published USEPA Ecological Soil Screening Level for a chemical, or it's inclusion in the USEPA's "Bioaccumulation Testing and Interpretation For The Purpose Of Sediment Quality Assessment - Status and Needs" (USEPA 2000). This is an expansive list of chemicals that cover major risk drivers at sites across the US. However, the large constituent list at OU-1 likely contains some chemicals that bioaccumulate, but that haven't been formally assessed for bioaccumulation potential and who's toxicity is unknown.	Unknown.
Use of literature derived exposure assumptions in the models	For OU-1, uptake modeling into plants, prey invertebrates, and prey mammals was based on standardized, genereric, widely-acceptable values. However, these values were not designed for hot, arid environments, or the specific soil-type and constituent mix at OU-1. These values were also not derived using the same species of plants, invertebrates, or prey mammals present at OU-1. Therefore, the standard uptake values (or equations) might differ widely from the chemical uptake that occurs in OU-1. There have been no uptake studes or collections of plants, insects, or prey mammals to directly measure the amount of chemicals in food items.	Unknown.
Use of literature derived exposure assumptions for receptor parameters	The model receptor organisms are based on literature- and guidance-derived values and do not reflect how organisms in OU-1 are actually exposed. The available receptor information is very rarely from animals in desert climates. For instance, there has been very little basic science published on how much burrowing owls eat, what species of insects the fringed myotis bats in the local area eat, and how much soil pocket mice incidentally consume when the groom themselves. The rate of food consumption, or accidental soil ingestion, or feeding preferences of the animals at OU-1 are likely specifically adapted for life there.	Unknown.
Area Use Factors	The AUF accounts for the fraction of the diet that an organism actually obtains from the site. The AUF takes into consideration the dietary fraction derived from a site based on the organism's foraging/feeding range (i.e., the mobility factor, which is the ratio between the site surface area and the foraging/feeding range), and seasonal exposure that limits exposure to certain periods of the year. High mobility animals have extensive foraging ranges and are known to obtain their diet from multiple locations, while low-mobility organisms such as invertebrates have a higher degree of exposure because most or all of their diet is derived from a smaller area. OU-1 is approximately 346 acres. Organisms whose home range is less than the site size is assumed to spend all their time at the site while organisms whose home range is greater than the site size is assumed to spend only a portion of their time at the site. Ramboll considered both a conservative approach to AUFs (AUF=1) and a more realistic scenario (AUF<1) in the risk assessment.	The AUF=1 scenario likely overestimates risk for receptors with large home ranges like the fringed myotis, mourning dove, kit fox, racoon, Cooper's hawk, and western burrowing owl.
Bird and mammal HQs based on maximum AUFs	Compounding conservative assumptions in the risk assessment likely yields extremely conservative (overestimated) risk estimates. Using an AUF = 1, the HQ values for the mammals and birds are based on the presumption that they live their entire lives within their exposure unit, consume food only from within their exposure unit, and food items live entirely within their exposure unit.	Likely causes a significant overestimation of risk.
Uncertainties in the Effects Assessment		
Adaptation To and Tolerance of Chemicals Present in OU-1	Life spans of receptors at OU-1 are 1-2 years (pocket mice, doves, robins), 2-3 years (shrews, raccoons), 3-4 years (foxes, coyotes), or up to 5-15 years (hawks, owls). The chemicals at OU-1 have been there for 25 or more years. That means that the receptors at OU-1 have experienced multiple generations of exposure to the chemicals at OU-1 (other than bats, who could live 20 years). Any organisms that were particularly sensitive to chemicals present at OU-1 have long since died or fled, and the genetic pressure on the indivuduals that remained would favor organisms that are less sensitive, or adapted to the chemicals present in OU-1.	Likely causes an overestimation of risk.
Chemical Form	Toxicity studies on a chemical of interest may not match the form that is present in OU-1. For instance, perchlorate is a salt and the toxicity testing literature includes studies on sodium, ammonium, or potassium perchlorate salts as well as just "perchlorate". Salts are expected to have little effect on toxicity, but there has been no study in OU-1 to determine which form the perchlorate is in and how that relates to the toxicity endpoints used in the risk assessment.	Unknown.
Wild Type Versus Lab Strain Organisms	The vast majority of test species that were used for toxicity testing come from lab grown strains of organisms. These organisms have been in captivity for hundreds (or more) of generations and have experienced selection pressure and genetic drift to adapt to lab water, food, and climate conditions. The animals at OU-1 have wild type genetics that may alter their responses to various chemicals.	Unknown.
Species-To-Species Extrapolations	While bats, owls, coyotes, and desert insects may be receptors of concern at OU-1 the toxicity studies used in this risk assessment are generally from lab or field studies on other organisms. Extrapolating mouse toxicity values to bats, or chicken toxicity studies to owls is uncertain because the lab species may not react like the species at OU-1.	Unknown.
Lab Testing Versus OU-1	Most laboratory tests take place under controlled temperature, water, food, and light conditions. Generally lab organisms are fed an appropriate ration so they are not stressed by hunger during toxicity testing. This is obviously different than OU-1 where organisms must avoid predation, and may be food- or hunger- or temperature-stressed.	Unknown.
Toxicity Endpoints	Every effort was made to make sure soil and wildlife toxicity values applied to relevant endpoints for growth, reproduction, or mortality. Endpoints like biochemical markers, gene regulation, and avoidance behavior were not used in this risk assessment. However, some toxicity studies are more relevant than others, and when there is a paucity of inforation (for instance soil toxicity data for manganese) then there are fewer ecologically relevant endpoints to choose from.	Unknown.

TABLE 4-11: Effects of Uncertainty in Ecological Risk Assessment
Nevada Environmental Response Trust Site
Henderson, Nevada

Source of Uncertainty	SLERA Management Approach	Effects on Risk Estimation
Uncertainties in Risk Characterization		
Interpretation of HQs	An HQ less than or equal to a value of 1 indicates that adverse impacts to wildlife are considered unlikely. However, there is no clear guidance for interpreting the HQs that exceed a value of 1, except that this point of departure may indicate that adverse effects of some kind may have occurred or may occur in the future.	Likely causes an overestimation of risk.
HQs With Unrealistic Magnitudes	The toxaphene maximum soil HQ of 10,000, the maximum concentration/no toxicity HQ of 500 for dioxin/furan TEQs for the shrews, or even the UCL/ no toxicity HQ of 10 for the hawk are difficult to intepret. While this might suggest acute toxicity, there are still soil invertebrates, small mammals, and hawks at OU-1 and they have not been extirpated. While an HQ greater than 1 indicates a need for further study, they do not scale linearly, and are difficult to compare between media and organisms.	Likely causes an overestimation of risk.
Assessing Risk One Chemical At a Time	Ecological risk assessment develops risk estimates one chemical at a time. However, at OU-1 an ecological receptor is exposted to several constituents at the same time, and may experience toxic effects from these chemicals simultaneously. The chemicals may be synergestic and cause more toxicity because of their combination than is expected from a single chemical.	Likely causes an underestimation of risk.
Background Concentrations that Exceed Ecotoxicity Screening Values	There are several metals that have background concentrations that are very high and in some cases exceed that chemicals ESV. For instance, the background HQs for aluminum range from 700-3000. The background HQs for iron range from 30-100. The background HQs for mercury range from below 1 to 8. However, the background area represents healthy desert ecosystems with appropriate wildlife and vegetation. The high HQs are from naturally occurring minerals that the ecosystem has adapted to.	Likely causes an overestimation of risk.
HQs for Individuals Used to Evaluate Risks to Populations	The assessment endpoints for OU-1 include "survival, growth, and reproductive ability of bird/mammal/reptile populations within the OU-1". However, the toxicity reference values used are for individual survival, growth, and reproduction. Extrapolating from individual impacts to population impacts is fraught with uncertainty (Tannenbaum 2003; Durda and Preziosi 1999). Even if the food web model indicates reductions in survival, growth and reproduction of some individuals, such data alone cannot be used directly to estimate adverse effects to populations, communities, or ecosystems (Forbes and Calow, 1999).	Unknown.
Detection Limits That Exceed Ecotoxicity Screening Values	There are occasions when analytical sample quantitation limits exceed ecoological screening values. This can be due to instrument and method limitations and/or due to interference from unrelated chemicals (e.g., dilutions required to bring some other chemical within a calibration range). This uncertainty is described in detail in Section 4.7.6 and Table 4.13a and 4-13b.	Unknown.

(d) Iron: OEHHA 2000: https://oehha.ca.gov/media/downloads/crnr/apeng.pdf
Biodegradation as such is not expected to occur with metals and other elements because of their elemental nature. Therefore, as a default estimate the metal content of soil is assumed to decay with a half-life of 108 days unless site-specific information is presented showing that soil conditions will result in the loss of soil metal content (such as from leaching or weathering).

(e) bis(2-Ethylhexyl)phthalate: Kim, D., R. Cui, J. Moon, J.I. Kwak, and Y. An. 2019. Soil Ecotoxicity Study of DEHP with respect to multiple soil species. Chemosphere 216: 387-395.
Environment Canada 1994: https://www.canada.ca/en/health-canada/services/environmental-workplace-health/reports-publications/environmental-contaminants/canadian-environmental-protection-act-priority-substances-list-report-2-ethylhexyl-pthalate.html

BCF = Bioconcentration factor
EC10 = Effect concentration (10% population)
ECHA = European Chemicals Agency
ESVs = Ecological screening values
FOD = Frequency of detection
HQ = Hazard quotient
LC10 = Lethal concentration (10% population)
mg/kg = Milligram(s)/kilogram
min = Minimum
NA = Not applicable
NOEC = No observed effect concentration
SQL = Sample quantitation limit
UCL = Upper confidence limit

TABLE 4-12d: Uncertainty Evaluation for Detected Chemicals Lacking Invertebrate-Specific ESVs
Nevada Environmental Response Trust Site
Henderson, Nevada

Chemical Group	Chemical Name	Summary Statistics					Sample Year Range	Most Recent Detection Date	Fail Statistical Testing for Background Consistency? (a)	Consideration of Half-Life in Soil					Consideration of Additional Toxicity Data				Bioaccumulative? (c)
		# Samples	# Detects	FOD	Maximum Detection (mg/kg)	95% UCL (mg/kg)				Half-Life in Soil		Number of Half-Lives Since Most Recent Detection	Estimated Present Day Concentration (mg/kg)	Constituent still present based on Half-Life?	Plant Toxicity of the constituent or a Surrogate Chemical(s) (mg/kg) (b)	Surrogate/ Source	Maximum HQ > 1?	95UCL HQ > 1?	
Metals	Iron	178	178	100%	1.40E+05	1.91E+04	2006 - 2018	12/18/2018	Yes	10^8 days	OEHHA 2000 (d)	0	1.4E+05	Yes	--	(b)	-	-	High (BCF Range is 3.4 to 2.8E+7)
Metals	Boron	178	171	96%	1.51E+03	5.34E+01	2006 - 2018	12/18/2018	Yes	10^8 days	OEHHA 2000 (d)	0	1.5E+03	Yes	13.8	EC10 range from 13.8 to 70.1 mg/kg dw for 21 to 56 days for terrestrial macroorganisms and arthropods. NOECs (21 days to 63 days) ranged from 5.2 to 315 mg/kg dw. Lowest EC10 is used.	Yes	Yes	No to low potential (BCF: 18)

Notes:

(a) Details regarding the background evaluation is provided in Appendix C. "Yes" indicates that Site concentrations are significantly greater than background or there is a low detection frequency for this chemical but visual inspection of QQ/boxplots indicate site not consistent with background and therefore the chemical cannot be eliminated based on comparison to background. "No" indicates that Site data is constistent with background or for low detection frequency chemicals, visual inspection of QQ/boxplots indicate site is consistent with background. NA: not applicable. Bkg evalulation only for metals and radionuclides.

(b) A literature review was conducted to find toxicity information using sources such as USEPA EcoTox, ORNL RAIS, ECHA, and Google Scholar. Pertinent invertebrate toxicity information for the chemical is stated if found; otherwise, information was not found regarding invertebrate toxicity.

(c) BCFs pulled from USEPA CompTox Chemicals Dashboard: https://comptox.epa.gov/dashboard/.

(d) Biodegradation is not expected to occur with metals and other elements because of their elemental nature. Therefore, as a default estimate the metal content of soil is assumed to decay with a half-life of 10^8 days unless site-specific information is presented showing that soil conditions will result in the loss of soil metal content (such as from leaching or weathering) (OEHHA 2000. Technical Support Document for Exposure Assessment and Stochastic Analysis. https://oehha.ca.gov/media/downloads/crnr/apeng.pdf)

BCF = Bioconcentration factor
EC10 = Effect concentration (10% population)
ESVs = Ecological screening values
dw = Dry weight
FOD = Frequency of detection
HQ = Hazard quotient
mg/kg = Milligram(s)/kilogram
NA = Not applicable
NOEC = No observed effect concentration

Notes:

The Operations Area includes the combined area of Eco DU-1, Eco DU-2, and Eco DU-3.

The OU-1 Refined SLERA Study Area includes the Operations Area and Parcel E.

ECAs in the interior of the Site that contain no significant attractive features for wildlife and therefore wildlife would not forage or nest there were excluded from the Refined SLERA. Those ECAs that are at or near the boundary of the Site (i.e. in Eco DU-1) and have vegetation or other features that are potentially attractive to wildlife were considered in the refined SLERA.

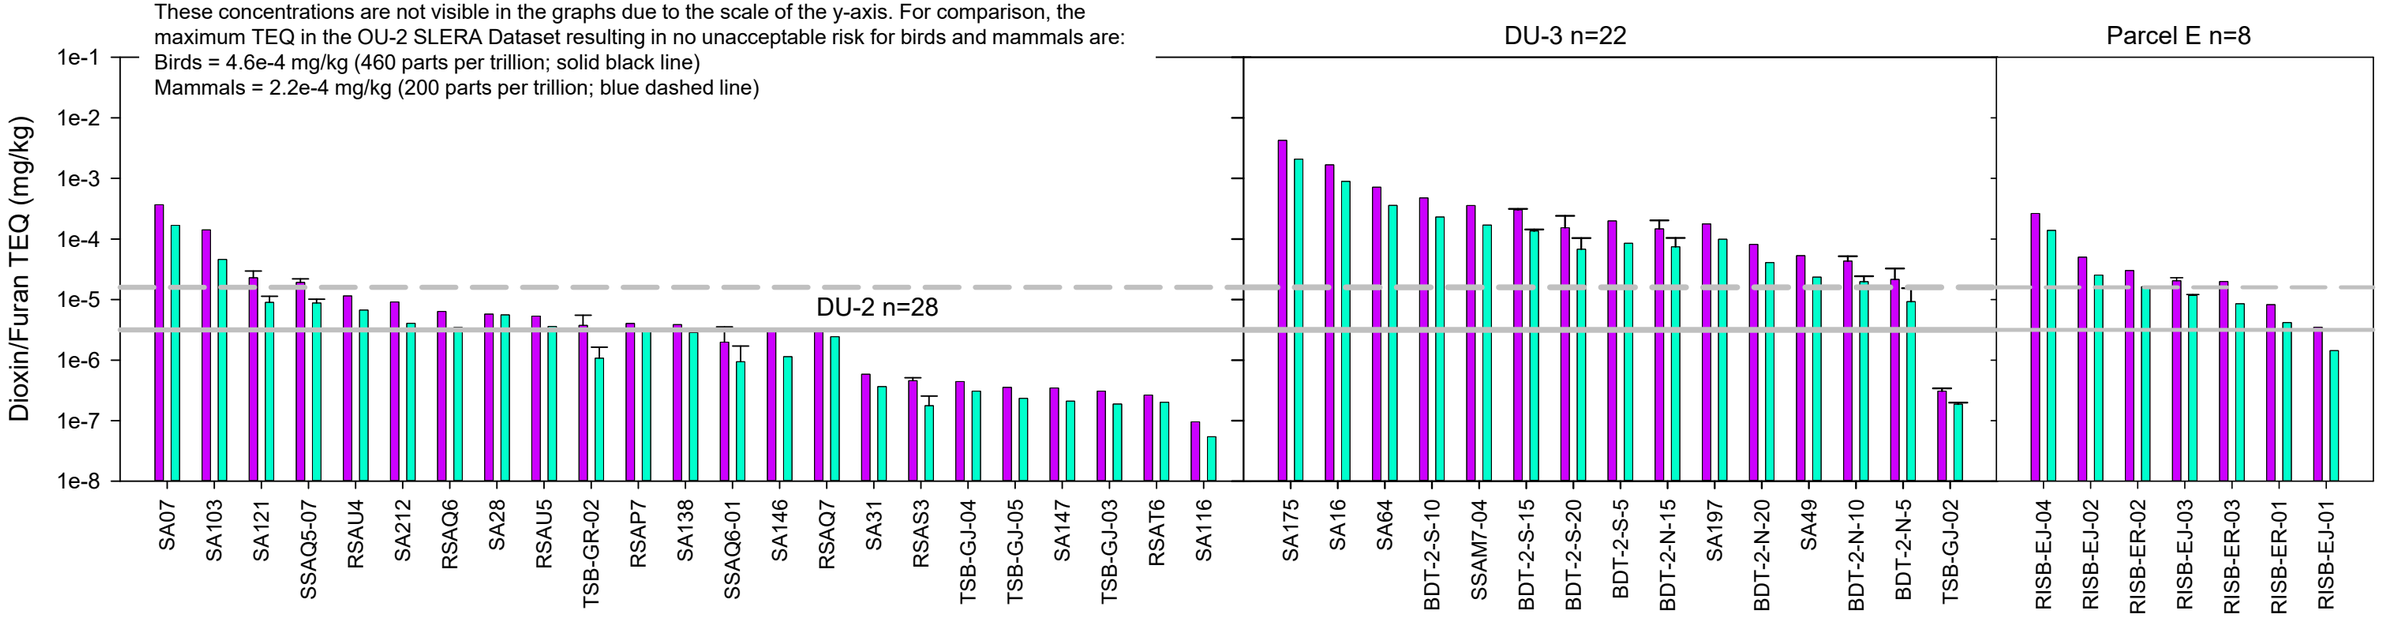
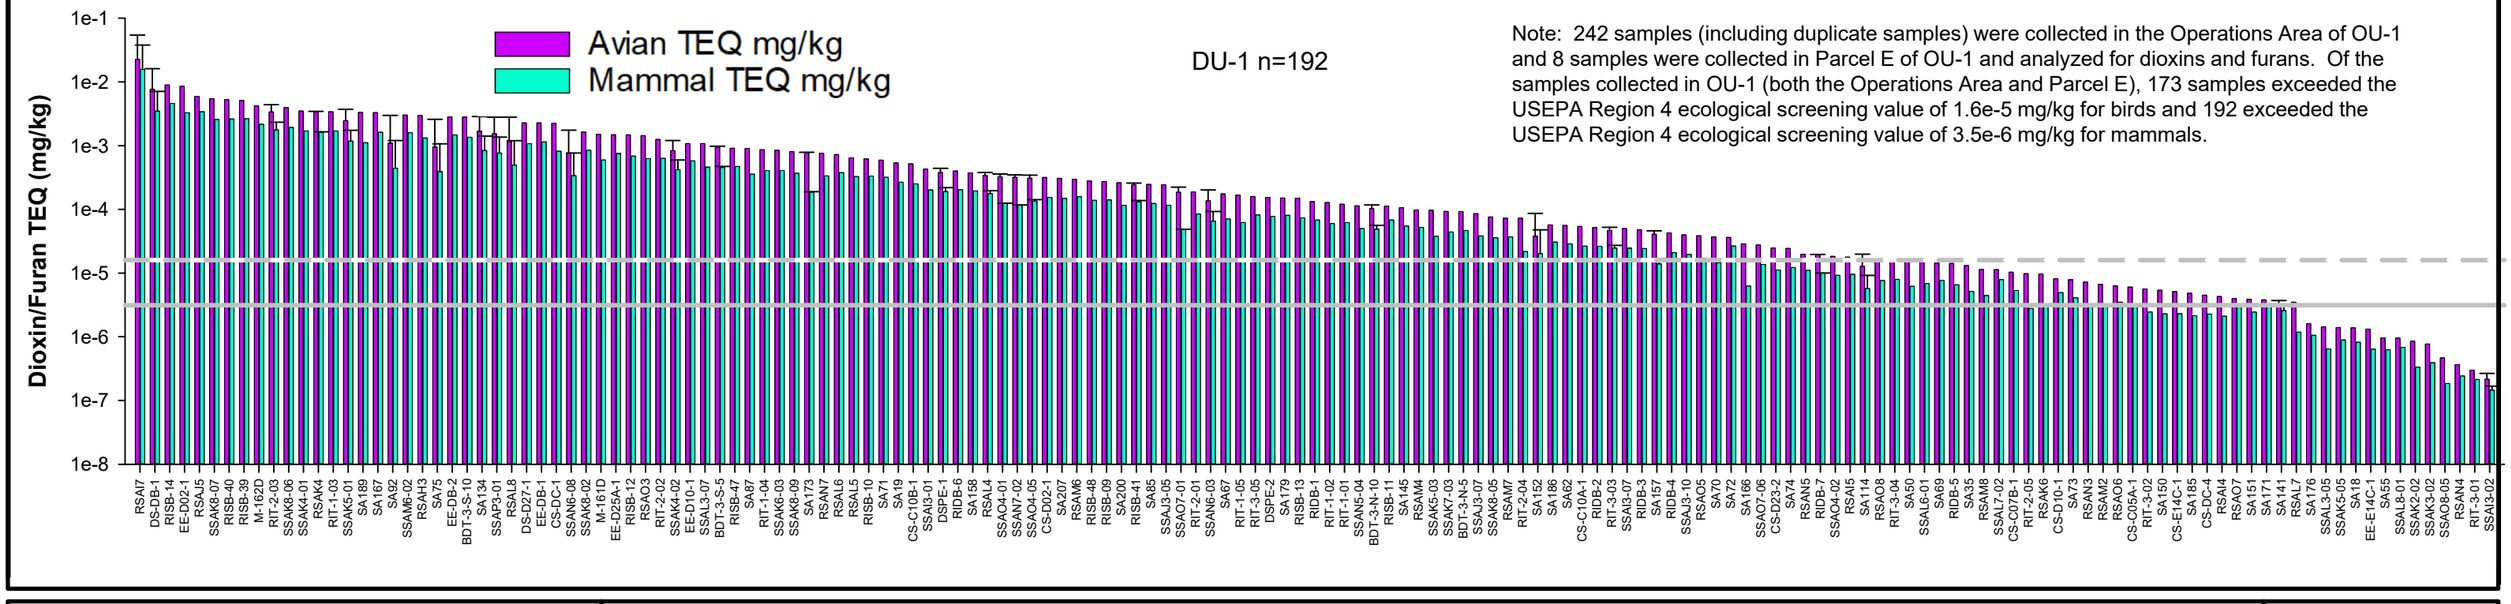
ESV R4 (Birds) = 1.6e-5 mg/kg
ESV R4 (Mammals) = 3.5e-6 mg/kg
These concentrations are not visible in the graphs due to the scale of the y-axis. For comparison, the maximum TEQ in the OU-2 SLERA Dataset resulting in no unacceptable risk for birds and mammals are:
Birds = 4.6e-4 mg/kg (460 parts per trillion; solid black line)
Mammals = 2.2e-4 mg/kg (200 parts per trillion; blue dashed line)

Dashed gray line = USEPA Region 4 ecological screening value for birds of 1.6e-5 mg/kg
Solid gray line = USEPA Region 4 ecological screening value for mammals of 3.5e-6 mg/kg





Note: 242 samples (including duplicate samples) were collected in the Operations Area of OU-1 and 8 samples were collected in Parcel E of OU-1 and analyzed for dioxins and furans. Of the samples collected in OU-1 (both the Operations Area and Parcel E), 173 samples exceeded the USEPA Region 4 ecological screening value of 1.6e-5 mg/kg for birds and 192 exceeded the USEPA Region 4 ecological screening value of 3.5e-6 mg/kg for mammals.

CHECKLIST FOR ECOLOGICAL ASSESSMENT/SAMPLING

Introduction

The checklist that follows provides guidance in making observations for an ecological assessment. It is not intended for limited or emergency response actions (e.g., removal of a few drums) or for purely industrial settings with no discharges. The checklist is a screening tool for preliminary site evaluation and may also be useful in planning more extensive site investigations. It must be completed as thoroughly as time allows. The results of the checklist will serve as a staring point for the collection of appropriate biological data to be used in developing a response action. It is recognized that certain questions in this checklist are not universally applicable and that site-specific conditions will influence interpretation. Therefore, a site synopsis is requested to facilitate final review of the checklist by a trained ecologist.

Checklist

The checklist has been divided into sections that correspond to data collection methods and ecosystem types. These sections are:

I Site Description

- IA. Summary of Observations and Site Setting

II Terrestrial Habitat Checklist

- IIA. Wooded
- IIB. Shrub/Scrub
- IIC. Open Field
- IID. Miscellaneous

III Aquatic Habitat Checklist – Non-Flowing Systems

IV Aquatic Habitat Checklist – Flowing Systems

V Wetlands Habitat Checklist

Checklist for Ecological Assessment/Sampling

I. SITE DESCRIPTION

1. Site Name: Nevada Environmental Trust Site

   Location: Henderson, Nevada

   County: Clark City: Henderson State: Nevada

2. Latitude: 36° 02' 35.4" N Longitude: 114° 59' 58.7" W

3. What is the approximate area of the site: 350 Acres

4. Is this the first site visit? (Yes) No. If no, attach trip report of previous site visit(s), if available.

   Date(s) of previous site visit(s): _____

5. Please attach to the checklist USGS topographic map(s) of the site, if available.

6. Are aerial or other site photographs available? (Yes) No. If yes, please attach any available photo(s) to the site map at the conclusion of this section.

Photo log provided as Appendix B of the Refined SLERA Work Plan. Maps have been provided in the Refined SLERA Work Plan.

7. The land use of the site is:

_____ % Urban

_____ % Rural

_____ % Residential

99 % Industrial (___ light ✓ heavy)

_____ % Agricultural

(Crops: _____)

_____ % Recreational

(Describe: note if it is a park etc.)

_____

_____

_____ % Undisturbed

_____ % Other

The area surrounding the site is:
_____ mile radius

30 % Urban

_____ % Rural

_____ % Residential

70 % Industrial (✓ light ✓ heavy)

_____ % Agricultural

(Crops: _____)

_____ % Recreational

(Describe: note if it is a park, etc.)

_____

_____

_____ % Undisturbed

_____ % Other

8. Has any movement of soil taken place at the site? ✓ Yes ___ No. If yes, please identify the most likely cause of this disturbance:

Agricultural Use	Heavy Equipment	Mining
Natural Events	Erosion	Other

Please describe:

Contaminated soil has been removed. Details of the soil removal can be found in the "Interim Soil Removal Action Completion Report" (ENVIRON 2012).

9. Do any potential sensitive environmental areas exist adjacent to or in proximity to the site, e.g., Federal and State parks, National and State monuments, wetlands, prairie potholes? *Remember, flood plains and wetlands are not always obvious; do not answer "no" without confirming information.*

Las Vegas Wash (2.5 miles) / Clark Co Wetlands Park (7.1 miles from site)
Henderson Bird Viewing Preserve (5.8 miles from site)

Please provide the source(s) of the information used to identify these sensitive areas, and indicate their general location on the site map.

Google Earth, USGS topo maps, area maps, Site Maps

10. What type of facility is located at the site?

(Chemical) Manufacturing Mixing Waste disposal

Other (specify)_____

11. What are the suspected contaminants of concern at the site? If know, what are the maximum concentration levels?

Perchlorate, metals, dioxins, PAHs

12. Check any potential routes of off-site migration of contaminants observed at the site:

Swales Depressions (Drainage ditches) Beta Ditch * See below

Runoff Windblown particulates Vehicular traffic

Other (specify)_____

13. If known, what is the approximate depth to the water table? 35 to 40 feet below ground surface

14. Is the direction of surface runoff apparent from site observations? yes (no) If yes, to which of the following does the surface runoff discharge? Indicate all that apply.

Surface water Groundwater Sewer Collection impoundment

15. Is there a navigable waterbody or tributary to a navigable waterbody? yes (no)

* The facility area was graded so that stormwater would be retained on-site. Also, two main designated retention basins and a drainage channel to collect storm water. The retention basins are typically dry.

16. Is there a waterbody anywhere on or in the vicinity of the site? If yes, also complete Section III: Aquatic Habitat Checklist – Non-Flowing Systems and/or Section IV: Aquatic Habitat Checklist – Flowing Systems.

yes (approx. distance _____) (no)

17. Is there evidence of flooding? yes (no) *Wetlands and flood plains are not always obvious; do not answer "no" without confirming information.* If yes, complete Section V: Wetland Habitat Checklist.

18. If a field guide was used to aid any of the identifications, please provide a reference. Also, estimate the time spent identifying fauna. [Use a blank sheet if additional space is needed for text.]

The Site reconnaissance was conducted by a certified biologist.

The Peterson field Guides were used during the Site Recon.

19. Are any threatened and/or endangered species (plant or animal) known to inhabit the area of the site? (yes) no *If yes, you are required to verify this information with the U.S. Fish and Wildlife Service.* If species' identities are known, please list them next.

There are currently three species federally-listed as threatened or endangered under ESA. These include desert tortoise (Gopherus agassizii), Southwestern willow flycatcher (Empidonax traillii extimus), and the Yuma Clapper rail (Rallus longirostris yumanensis). These species may be found at Clark Co. Wetlands, LV Wash or Bird Preserve but are not found in or around the immediate vicinity of the Site.

20. Record weather conditions at the time this checklist was prepared:

Date: Dec. 10 - 11

60-63 Temperature (C/(F))

4-5 mph Wind (direction/speed)

30% Cloud cover

56°F Normal daily high temperature

0 inch Precipitation ((rain), snow)

IA. SUMMARY OF OBSERVATIONS AND SITE SETTING

The ecology at the NERT Site is barren and dry with little or no vegetation. The few plants on the property are sparsely distributed and are less than 2 feet high (see photo log - Appendix B of the Refined SLERA Work Plan). Outside of the fenceline shrubs reach heights of approximately 5-6 feet. No mammals were observed on the Site during the two day site reconnaissance. However, coyote have been observed outside of the fenceline and on the property on the debris pile (see figure 1-3 of the Refined SLERA Work Plan).

A red-tailed hawk was observed on a telephone wire off Boulder Highway on Parcel D to the north of the Site. A burrowing owl was observed outside of the eastern fence line.

Completed by Linda Martello Affiliation ENVIRON

Additional Preparers

Site Manager John Pekala (ENVIRON)

Date Dec 11, 2014

II TERRESTRIAL HABITAT CHECKLIST

IIA. WOODED

1. Are there any wooded areas at the site? yes (no) If no, go to Section IIB: Shrub/Scrub.

2. What percentage or area of the site is wooded? (_____ % _____ acres). Indicate the wooded area on the site map which is attached to a copy of this checklist. Please identify what information was used to determine the wooded area of the site.

N/A

3. What is the dominant type of vegetation in the wooded area? (Circle one: Evergreen/Deciduous/Mixed) Provide a photograph, if available. N/A

Dominant plant, if known: _____

4. What is the predominant size of the trees at the site? Use diameter at breast height. N/A

0 - 6 in. 6 - 12 in. >12 in.

5. Specify type of understory present, if known. Provide a photograph, if available.

Photos of vegetation are provided in Appendix B of the Refined SLERA Work Plan.

IIB. SCHRUB/SCRUB

1. Is shrub/scrub vegetation present at the site? (yes) no If no, go to Section IIC: Open Field.

2. What percentage of the site is covered by scrub/shrub vegetation? (_1_ % _____ acres). Indicate the areas of shrub/scrub on the site map. Please identify what information was used to determine this area.

Shrubs occur intermittently along the fence line and in small (5 x 5 ft) patches near drainage areas (Beta ditch)

3. What is the dominant type of scrub/shrub vegetation, if known? Provide a photograph, if available.

Dominant shrub type is creosote bush, sagebrush

4. What is the approximate average height of the scrub/shrub vegetation?

(0 - 2 ft.) 2 - 5 ft. > 5 ft.

5. Based on site observations, how dense is the scrub/shrub vegetation?

Dense Patchy (Sparse) very sparse

IIC. OPEN FIELD

1. Are there open (bare, barren) field areas present at the site? yes (no) If yes, please indicate the type below:

Prairie/plains Savannah Old field Other (specify) _____

2. What percentage of the site is open field? (_____ % _____ acres). Indicate the open fields on the site map.

3. What is/are the dominant plant(s)? Provide a photograph, if available.

4. What is the approximate average height of the dominant plant? _____

5. Describe the vegetation cover: Dense Sparse Patchy

IID. MISCELLANEOUS

1. Are other types of terrestrial habitats present at the site, other than woods, scrub/shrub, and open field? yes (no) If yes, identify and describe them below.

2. Describe the terrestrial miscellaneous habitat(s) and identify these area(s) on the site map.

A photo log is provided in Appendix B of the refined SLERA Work Plan.

3. What observations, if any, were made at the site regarding the presence and/or absence of insects, fish, birds, mammals, etc.?

Small song birds were observed intermittently at the site. A burrowing owl was observed by staff on the east side of OU-1 at the eastern end of the Beta Ditch outside of the fence.

4. Review the questions in Section I to determine if any additional habitat checklists should be completed for this site.

III AQUATIC HABITAT CHECKLIST

Note: Aquatic systems are often associated with wetland habitats. Please refer to Section V, Wetland Habitat Checklist.

1. What type of open-water, non-flowing system is present at the site?

   Natural (pond, lake)
   Artificially created (lagoon, reservoir, canal, impoundment) - permitted pond - not habitat

2. If known, what is the name(s) of the waterbody(ies) on or adjacent to the site?
   WC-West, WC-East, Mn-1, GW-11

3. If a waterbody is present, what are its known uses (e.g., recreation, navigation, etc.)?
   Process water, extracted groundwater from Remediation activities

4. What is the approximate size of the waterbody(ies)? _____ acre(s).
   GW11 = 9.5 acres, WC-West + WC-East = 2.6 acres each

5. Is any aquatic vegetation present? yes (no) If yes, please identify the type of vegetation present if known.

   Emergent Submergent Floating

6. If known, what is the depth of the water? approximately 9-10 feet

7. What is the general composition of the substrate? Check all that apply.

Bedrock	Sand (coarse)	Muck (find/black)
Boulder (>10 in.)	Silt (fine)	Debris
Cobble (2.5 - 10 in.)	Marl (shells)	Detritus
Gravel (0.1 - 2.5 in.)	Clay (slick)	Concrete

   Other (specify) Concrete lined

8. What is the source of water in the waterbody?

River/Stream/Creek	Groundwater	(Industrial discharge)
Surface runoff	Other (specify) _____	

9. Is there a discharge from the site to the waterbody? (yes) no If yes, please describe this discharge and its path.

The ponds contain process-related water and groundwater from remediation activities.

10. Is there a discharge from the waterbody? yes (no.) If yes, and the information is available, identify from the list below the environment into which the waterbody discharges.

River/Stream/Creek	onsite	offsite	Distance _____
Groundwater	onsite	offsite	
Wetland	onsite	offsite	Distance _____
Impoundment	onsite	offsite	

11. Identify any field measurements and observations of water quality that were made. For those parameters for which data were collected provide the measurement and the units of measure below:

No measurements were made During the Site Recon.

~ 414,000 Sq. Ft. Area

20ft. ~~to top~~ of Berm Depth (average)

NA Temperature (depth of the water at which the reading was taken) _____

NA pH

NA = Not available

NA Dissolved oxygen

NA Salinity

NA Turbidity (clear, slightly turbid, turbid, opaque) (Seecchi disk depth _____)

— Other (specify)

12. Describe observed color and area of coloration.

Dark consistent with the black liner.

13. Mark the open-water, non-flowing system on the site map attached to this checklist.

14. What observations, if any, were made at the waterbody regarding the presence and/or absence of benthic macroinvertebrates, fish, birds, mammals, etc.?

Several mallards and coots were observed. However, no dabbling was observed during the observation period (1/2 hour)

IV AQUATIC HABITAT CHECKLIST – FLOWING SYSTEMS Not Applicable

Note: Aquatic systems are often associated with wetland habitats. Please refer to Section V, Wetland Habitat Checklist.

1. What type(s) of flowing water system(s) is (are) present at the site? None

River	Stream	Creek
Dry wash	Arroyo	Brook
Artificially created (ditch, etc.)	Intermittent Stream	Channeling

Other (specify) _____

2. If known, what is the name of the waterbody? _____

3. For natural systems, are there any indicators of physical alteration (e.g. channeling, debris, etc.)? yes no If yes, please describe indicators that were observed.

4. What is the general composition of the substrate? Check all that apply.

Bedrock	Sand (coarse)	Muck (find/black)
Boulder (>10 in.)	Silt (fine)	Debris
Cobble (2.5 - 10 in.)	Marl (shells)	Detritus
Gravel (0.1 - 2.5 in.)	Clay (slick)	Concrete

Other (specify) _____

5. What is the condition of the bank (e.g., height, slope, extent of vegetative cover)?

6. Is the system influenced by tides? yes no What information was used to make this determination?

7. Is the flow intermittent? yes no If yes, please note the information that was used in making this determination.

8. Is there a discharge from the site to the waterbody? yes no If yes, please describe the discharge and its path.

9. Is there a discharge from the waterbody? yes no If yes, and the information is available, please identify what the waterbody discharges to and whether the discharge is on site or off site.

10. Identify any field measurements and observations of water quality that were made. For those parameters for which data were collected, provide the measurement and the units of measure in the appropriate space below:

_____ Area

_____ Depth (average)

_____ Temperature (depth of the water at which the reading was taken) _____

_____ pH

_____ Dissolved oxygen

_____ Salinity

_____ Turbidity (clear, slightly turbid, turbid, opaque) (Seecchi disk depth _____)

_____ Other (specify)

11. Describe observed color and area of coloration.

12. Is any aquatic vegetation present? yes no If yes, please identify the type of vegetation present, if know.

Emergent Submergent Floating

13. Mark the flowing water system on the attached site map.

14. What observations were made at the waterbody regarding the presence and/or absence of benthic macroinvertebrates, fish, birds, mammals, etc.?

V. WETLAND HABITAT CHECKLIST

1. Based on observation and/or available information, are designated or known wetland definitely present at the site? yes (no)

No wetland is present at the Site

Please note the sources of observations and information used (e.g., USGS Topographic Maps, National Wetland Inventory, Federal or State Agency, etc.) To make this determination.

Site reconnaissance, Google Earth Maps

2. Based on the location of the site (e.g., along a waterbody, in a floodplain) and site conditions (e.g. standing water, dark, wet soils; mud cracks; debris line; water marks), are wetland habitats suspected? yes (no) If yes, proceed with the remainder of the wetland habitat identification checklist.

3. What type(s) of vegetation are present in the wetland? N/A

   Submergent Emergent Scrub/Shrub Wooded
   Other (specify) _____

4. Provide a general description of the vegetation present in and around the wetland (height, color, etc.). Provide a photograph of the known or suspected wetlands, if available.

5. Is standing water present? yes (no) If yes, is water: Fresh Brackish
   What is the approximate area of the water (sq. ft.) _____
   Please complete questions 4, 11, 12 in Checklist III - Aquatic Habitat – Non-Flowing Systems.

6. Is there evidence of flooding at the site? What observations were noted?

   Buttressing Water marks Mud cracks

   Debris line Other (describe below)

7. If known, what is the source of the water in the wetland? N/A

Stream/River/Creek/Lake/Pond | Groundwater

Flooding | Surface Runoff

8. Is there a discharge from the site to a known or suspected wetland? yes no If yes, please describe.

Potential impacted groundwater discharge from the Site to surface water at Las Vegas Wash (2 miles). Mitigation measures in the form of an extraction and treatment system is in place. Discharges into the Las Vegas Wash have been significantly reduced. Following aquifer restoration, the Trust will conduct an ERA for downgradient areas including the wash.

9. Is there a discharge from the wetland? yes no If yes, to what waterbody is discharge released?

Surface Stream/River | Groundwater | (Lake/Pond) | Marine

Las Vegas wash empties into Lake Mead

10. If a soil sample was collected, describe the appearance of the soil in the wetland area. Circle or write in the best response.

Color (blue/grey, brown, black, mottled) _____

Water content (dry, wet, saturated/unsaturated) _____

11. Mark the observed area(s) on the attached site map.

See Figure 1-2 of the Refined SLERA Work Plan

APPENDIX A-2
USEPA COMPLETED ECOLOGICAL SITE RECONNAISSANCE CHECKLIST
June 2022

APPENDIX A - CHECKLIST FOR ECOLOGICAL ASSESSMENT/SAMPLING

Introduction

The checklist that follows provides guidance in making observations for an ecological assessment. It is not intended for limited or emergency response actions (e.g., removal of a few drums) or for purely industrial settings with no discharges. The checklist is a screening tool for preliminary site evaluation and may also be useful in planning more extensive site investigations. It must be completed as thoroughly as time allows. The results of the checklist will serve as a starting point for the collection of appropriate biological data to be used in developing a response action. It is recognized that certain questions in this checklist are not universally applicable and that site-specific conditions will influence interpretation. Therefore, a site synopsis is requested to facilitate final review of the checklist by a trained ecologist.

Checklist

The checklist has been divided into sections that correspond to data collection methods and ecosystem types. These sections are:

I. Site Description

   IA. Summary of Observations and Site Setting

II. Terrestrial Habitat Checklist

   IIA. Wooded
   IIB. Shrub/Scrub
   IIC. Open Field
   IID. Miscellaneous

III. Aquatic Habitat Checklist -- Non-Flowing Systems

IV. Aquatic Habitat Checklist -- Flowing Systems

V. Wetlands Habitat Checklist

Checklist for Ecological Assessment/Sampling

I. SITE DESCRIPTION

1. Site Name: Nevada Environmental Response Trust Operable Unit 1
   Location: Henderson, Nevada

   County: Clark City: Henderson State: Nevada

2. Latitude: 36°02'35.4"N Longitude: 114°59'58.7"W

3. What is the approximate area of the site? 346 acres

4. Is this the first site visit? ☐ yes ☑ no If no, attach trip report of previous site visit(s), if available.
   Date(s) of previous site visit(s): December 2014 Attached as Appendix A-1

5. Please attach to the checklist USGS topographic map(s) of the site, if available.
   Maps are provided throughout the report

6. Are aerial or other site photographs available? ☐ yes ☐ no If yes, please attach any available photo(s) to the site map at the conclusion of this section.
   Maps are provided throughout the report and a complete photolog that includes photos from 12/2014 and 6/2022 are provided in Appendix B.

7. The land use on the site is:

_____% Urban	20 % Urban
_____% Rural	_____% Rural
_____% Residential	20 % Residential
99.5 % Industrial (☐ light ☑ heavy)	60 % Industrial (☑ light ☑ heavy)
_____% Agricultural	_____% Agricultural
(Crops: 0.5 +/- Fallow field Parcel E)	(Crops: _____)
_____% Recreational	_____% Recreational
(Describe; note if it is a park, etc.)	*(Describe; note if it is a park, etc.)*
_____	_____
_____	_____
_____% Undisturbed	_____% Undisturbed
_____% Other	_____% Other

8. Has any movement of soil taken place at the site? ☑ yes ☐ no. If yes, please identify the most likely cause of this disturbance:

_____ Agricultural Use	_____ Heavy Equipment	_____ Mining
_____ Natural Events	_____ Erosion	_____ Other

Please describe:

Contaminated soil has been removed from various locations within the OU-1 Study Area. Details of the various soil removal actions can be found in the OU-1 Remedial Investigation (Ramboll 2023) and in the "Interim Soil Removal Action Completion Report" (ENVIRON 2012).

9. Do any potentially sensitive environmental areas exist adjacent to or in proximity to the site, e.g., Federal and State parks, National and State monuments, wetlands, prairie potholes? *Remember, flood plains and wetlands are not always obvious; do not answer "no" without confirming information.*

- Las Vegas Wash (2.5 miles)
- Clark County Wetlands Park (7.1 miles)
- Henderson Bird Viewing Preserve (5.8 miles)

Please provide the source(s) of information used to identify these sensitive areas, and indicate their general location on the site map.

10. What type of facility is located at the site?

☑ Chemical ☑ Manufacturing ☐ Mixing ☐ Waste disposal

☐ Other (specify)_____

11. What are the suspected contaminants of concern at the site? If known, what are the maximum concentration levels?

Perchlorate, Dioxins/Furans, Manganese, certain pesticides, certain SVOCs.

12. Check any potential routes of off-site migration of contaminants observed at the site:

☐ Swales ☐ Depressions ☐ Drainage ditches

☐ Runoff ☑ Windblown particulates ☐ Vehicular traffic

☐ Other (specify) Drainage ditches were remediated to no longer flow off-site.

13. If known, what is the approximate depth to the water table? 30-40 feet

14. Is the direction of surface runoff apparent from site observations? ☐ yes ☑ no If yes, to which of the following does the surface runoff discharge? Indicate all that apply.

☐ Surface water ☐ Groundwater ☐ Sewer ☐ Collection impoundment

15. Is there a navigable waterbody or tributary to a navigable waterbody? ☐ yes ☑ no

16. Is there a waterbody anywhere on or in the vicinity of the site? If yes, also complete Section III: Aquatic Habitat Checklist -- Non-Flowing Systems and/or Section IV: Aquatic Habitat Checklist -- Flowing Systems.

☑ yes (approx. distance LVW 2.5 miles from OU-1) ☐ no There is a retention pond (OW-11) on site that is not a wetland and is plastic-lined

17. Is there evidence of flooding? ☐ yes ☑ no *Wetlands and flood plains are not always obvious; do not answer "no" without confirming information.* If yes, complete Section V: Wetland Habitat Checklist.

18. If a field guide was used to aid any of the identifications, please provide a reference. Also, estimate the time spent identifying fauna. [Use a blank sheet if additional space is needed for text.]

The site recon was conducted by a qualified biologist in 2014 and 2022. The same biologist conducted both site recons. The Peterson Guide and the Clark County Multiple Species Habitat Conservation Plan were consulted.

19. Are any threatened and/or endangered species (plant or animal) known to inhabit the area of the site? ☐ yes ☑ no *If yes, you are required to verify this information with the U.S. Fish and Wildlife Service.* If species' identities are known, please list them next.

There are several special status species present within Clark County. These species have the potential to be present within the Las Vegas Wash Area but not within OU-1

20. Record weather conditions at the time this checklist was prepared:

DATE: _____

80 Temperature (°C/°F) — 75 % Normal daily high temperature

15 mph Wind (direction/speed) — 0 Precipitation (rain, snow)

20 % Cloud cover

IA. SUMMARY OF OBSERVATIONS AND SITE SETTING

As described in the ecological checklist prepared in 2014, the ecology within OU-1 is devoid of quality habitat. The soils are heavily compacted & vegetation is sparse to nonexistent consisting of individual scrub vegetation cropping up in cracks along abandoned cement structure where a fraction of water can accumulate. See photo log provided as Appendix B.

Wildlife does not frequent the site due to lack of habitat, lack of foraging opportunities. Historically, there have been observations of coyote trotting across the site but no observations of coyote or other wildlife has been observed in several years. Road runners at the entrance of OU-1 are still observed.

Completed by Linda Martella Affiliation Ramboll

Additional Preparers —

Site Manager Chris Stubbs

Date June 2022

II. TERRESTRIAL HABITAT CHECKLIST

IIA. WOODED

1. Are there any wooded areas at the site? ☐ yes ☑ no If no, go to Section IIB: Shrub/Scrub.

2. What percentage or area of the site is wooded? (0 % _____ acres). Indicate the wooded area on the site map which is attached to a copy of this checklist. Please identify what information was used to determine the wooded area of the site.

3. What is the dominant type of vegetation in the wooded area? (Circle one: Evergreen/Deciduous/ Mixed) Provide a photograph, if available.

   Dominant plant, if known: N/A

4. What is the predominant size of the trees at the site? Use diameter at breast height. N/A

   ☐ 0-6 in. ☐ 6-12 in. ☐ > 12 in.

5. Specify type of understory present, if known. Provide a photograph, if available. N/A

   See photo log in Appendix B.

IIB. SHRUB/SCRUB

1. Is shrub/scrub vegetation present at the site? ☑ yes ☐ no If no, go to Section IIC: Open Field.

2. What percentage of the site is covered by scrub/shrub vegetation? (0.1 % _____ acres). Indicate the areas of shrub/scrub on the site map. Please identify what information was used to determine this area.

   There is very little vegetation at the site. Weeds crop up in cracks near the fence line and along abandoned cement pads where water can accumulate.

3. What is the dominant type of scrub/shrub vegetation, if known? Provide a photograph, if available.

   Creosote bush, weeds

4. What is the approximate average height of the scrub/shrub vegetation?

   ☑ 0-2 ft. ☐ 2-5 ft. ☐ > 5 ft.

5. Based on site observations, how dense is the scrub/shrub vegetation?

☐ Dense ☐ Patchy ☑ Sparse – very

IIC. OPEN FIELD

1. Are there open (bare, barren) field areas present at the site? ☐ yes ☑ no If yes, please indicate the type below: area but Parcel E is a barren field. not with the Operation

☐ Prairie/plains ☐ Savannah ☑ Old field ☐ Other (specify)_____

2. What percentage of the site is open field? (_____%_____ acres). Indicate the open fields on the site map.

3. What is/are the dominant plant(s)? Provide a photograph, if available.

Creosote bush, sage brush, weeds.

4. What is the approximate average height of the dominant plant? 2-3 feet in Parcel E only

5. Describe the vegetation cover: ☐ Dense ☐ Sparse ☑ Patchy

IID. MISCELLANEOUS

1. Are other types of terrestrial habitats present at the site, other than woods, scrub/shrub, and open field? ☐ yes ☑ no If yes, identify and describe them below.

2. Describe the terrestrial miscellaneous habitat(s) and identify these area(s) on the site map.

See Photo log presented as Appendix B.

3. What observations, if any, were made at the site regarding the presence and/or absence of insects, fish, birds, mammals, etc.?

There is little to no wildlife within the Operations Area. Occasionally, ducks, coots will rest on the GW-11 pond but no dabbling was observed and the pond is plastic lined. The permitted pond is not considered wetland habitat in the ERA.

4. Review the questions in Section I to determine if any additional habitat checklists should be completed for this site.

No

III. AQUATIC HABITAT CHECKLIST -- NON-FLOWING SYSTEMS

Note: Aquatic systems are often associated with wetland habitats. Please refer to Section V, Wetland Habitat Checklist.

1. What type of open-water, non-flowing system is present at the site? None re natural system but there is a permitted retention pond (GW-11)

   ☐ Natural (pond, lake)
   ☐ Artificially created (lagoon, reservoir, canal, impoundment)

2. If known, what is the name(s) of the waterbody(ies) on or adjacent to the site?

   GW-11. The previous permitted ponds (WC-West, WC-east + Mo-1) have been closed/removed.

3. If a waterbody is present, what are its known uses (e.g.: recreation, navigation, etc.)?

4. What is the approximate size of the waterbody(ies)? 9.5 acre(s).
   GW-11

5. Is any aquatic vegetation present? ☐ yes ☑ no If yes, please identify the type of vegetation present if known.

   ☐ Emergent ☐ Submergent ☐ Floating

6. If known, what is the depth of the water? 9-10 feet

7. What is the general composition of the substrate? Check all that apply.

   ☐ Bedrock ☐ Sand (coarse) ☐ Muck (fine/black)
   ☐ Boulder (>10 in.) ☐ Silt (fine) ☐ Debris
   ☐ Cobble (2.5-10 in.) ☐ Marl (shells) ☐ Detritus
   ☐ Gravel (0.1-2.5 in.) ☐ Clay (slick) ☐ Concrete
   ☐ Other (specify) This is a concrete and plastic lined retention pond.

8. What is the source of water in the waterbody?

   ☐ River/Stream/Creek ☐ Groundwater ☐ Other (specify)_____
   ☑ Industrial discharge ☐ Surface runoff

9. Is there a discharge from the site to the waterbody? ☑ yes ☐ no If yes, please describe this discharge and its path.

The GW-11 pond contains process-related water related to remediation activities.

10. Is there a discharge from the waterbody? ☐ yes ☑ no If yes, and the information is available, identify from the list below the environment into which the waterbody discharges.

☐ River/Stream/Creek	☐ onsite	☐ offsite	Distance_____
☐ Groundwater	☐ onsite	☐ offsite	
☐ Wetland	☐ onsite	☐ offsite	Distance_____
☐ Impoundment	☐ onsite	☐ offsite	

11. Identify any field measurements and observations of water quality that were made. For those parameters for which data were collected provide the measurement and the units of measure below:

_____ Area See the OU-1 Remedial Investigation

_____ Depth (average) regarding the GW-11 pond.

_____ Temperature (depth of the water at which the reading was taken) _____

_____ pH

_____ Dissolved oxygen

_____ Salinity

_____ Turbidity (clear, slightly turbid, turbid, opaque) (Secchi disk depth _____)

_____ Other (specify)

12. Describe observed color and area of coloration.

Dark consistent with the black lining material in the pond.

13. Mark the open-water, non-flowing system on the site map attached to this checklist.

14. What observations, if any, were made at the waterbody regarding the presence and/or absence of benthic macroinvertebrates, fish, birds, mammals, etc.?

Ramboll is currently preparing the OU-3 Baseline Ecological Risk Assessment to characterize conditions within the Las Vegas Wash that is approximately 2.5 miles north of OU-1.

The GW-11 pond does not contain benthic invertebrate or fish as there is no bottom sediment and inverts and fish would have no foraging opportunities. Birds occassionally rest on the pond but do not forage. Mammals are not present.

IV. AQUATIC HABITAT CHECKLIST -- FLOWING SYSTEMS

No aquatic habitat within OU-1

Note: Aquatic systems are often associated with wetland habitats. Please refer to Section V, Wetland Habitat Checklist.

1. What type(s) of flowing water system(s) is (are) present at the site?

☐ River	☐ Stream	☐ Creek
☐ Dry wash	☐ Arroyo	☐ Brook
☐ Artificially created (ditch, etc.)	☐ Intermittent Stream	☐ Channeling
	☐ Other (specify)_____	

2. If known, what is the name of the waterbody?_____

3. For natural systems, are there any indicators of physical alteration (e.g., channeling, debris, etc.)?
☐ yes ☐ no If yes, please describe indicators that were observed.

4. What is the general composition of the substrate? Check all that apply.

☐ Bedrock	☐ Sand (coarse)	☐ Muck (fine/black)
☐ Boulder (>10 in.)	☐ Silt (fine)	☐ Debris
☐ Cobble (2.5-10 in.)	☐ Marl (shells)	☐ Detritus
☐ Gravel (0.1-2.5 in.)	☐ Clay (slick)	☐ Concrete
☐ Other (specify)_____		

5. What is the condition of the bank (e.g., height, slope, extent of vegetative cover)?

6. Is the system influenced by tides? ☐ yes ☐ no What information was used to make this determination?

7. Is the flow intermittent? ☐ yes ☐ no If yes, please note the information that was used in making this determination.

8. Is there a discharge from the site to the waterbody? ☑ yes ☐ no If yes, please describe the discharge and its path.

GW beneath OU-1 flows northward to the Las Vegas Wash

9. Is there a discharge from the waterbody? ☑ yes ☐ no If yes, and the information is available, please identify what the waterbody discharges to and whether the discharge is on site or off site.

Las Vegas Wash flows to Lake Mead

10. Identify any field measurements and observations of water quality that were made. For those parameters for which data were collected, provide the measurement and the units of measure in the appropriate space below:

____ Width (ft.) Please see the OU-1 Remedial Investigation Report (Ramboll 2023) for details surrounding the GW characterization.

____ Depth (ft.)

____ Velocity (specify units):

____ Temperature (depth of the water at which the reading was taken_____)

____ pH

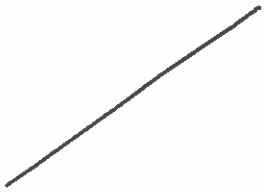
____ Dissolved oxygen

____ Salinity

____ Turbidity (clear, slightly turbid, turbid, opaque)
(Secchi disk depth _____)

____ Other (specify)_____

11. Describe observed color and area of coloration.



12. Is any aquatic vegetation present? ☐ yes ☑ no If yes, please identify the type of vegetation present, if known.

☐ Emergent ☐ Submergent ☐ Floating

13. Mark the flowing water system on the attached site map. N/A

14. What observations were made at the waterbody regarding the presence and/or absence of benthic macroinvertebrates, fish, birds, mammals, etc.?

No wetlands on the OU-1 property

V. WETLAND HABITAT CHECKLIST

1. Based on observations and/or available information, are designated or known wetlands definitely present at the site?
☐ yes ☑ no

   Please note the sources of observations and information used (e.g., USGS Topographic Maps, National Wetland Inventory, Federal or State Agency, etc.) to make this determination.

   In person Site Recon of OU-1 and Surrounding areas.
   USGS Topo Maps, NWI.

2. Based on the location of the site (e.g., along a waterbody, in a floodplain) and site conditions (e.g., standing water; dark, wet soils; mud cracks; debris line; water marks), are wetland habitats suspected?
☐ yes ☑ no If yes, proceed with the remainder of the wetland habitat identification checklist.

3. What type(s) of vegetation are present in the wetland? OU-1 does not contain a wetland

   ☐ Submergent ☐ Emergent
   ☐ Scrub/Shrub ☐ Wooded

   ☐ Other (specify)_____

4. Provide a general description of the vegetation present in and around the wetland (height, color, etc.). Provide a photograph of the known or suspected wetlands, if available.

5. Is standing water present? ☐ yes ☑ no If yes, is this water: ☐ Fresh ☐ Brackish
   What is the approximate area of the water (sq. ft.)?_____
   Please complete questions 4, 11, 12 in Checklist III - Aquatic Habitat -- Non-Flowing Systems.

6. Is there evidence of flooding at the site? What observations were noted? No

   ☐ Buttressing ☐ Water marks ☐ Mud cracks

   ☐ Debris line ☐ Other (describe below)

7. If known, what is the source of the water in the wetland?

☐ Stream/River/Creek/Lake/Pond ☑ Groundwater

☐ Flooding ☑ Surface Runoff

GW + SW are the sources of water to the Las Vegas Wash which is not on the OU-1 Property. The LVW is approximately 2.5 miles from OU-1

8. Is there a discharge from the site to a known or suspected wetland? ☑ yes ☐ no If yes, please describe.

GW beneath the OU-1 Study Area flows to the Las Vegas Wash.

9. Is there a discharge from the wetland? ☑ yes ☐ no. If yes, to what waterbody is discharge released?

☑ Surface Stream/River ☐ Groundwater ☐ Lake/Pond ☐ Marine

The Las Vegas Wash flows to Lake Mead

10. If a soil sample was collected, describe the appearance of the soil in the wetland area. Circle or write in the best response. Bank soils were taken from the LVW as part of the OU-3 Baseline Ecological Risk Assessment. The bank soils

Color (blue/gray, brown, black, mottled) ~~are generally sandy or if~~ right at the water line they are brown/black silty mud.

Water content (dry, wet, saturated/unsaturated) _____

11. Mark the observed wetland area(s) on the attached site map.

A site map is provided in the OU1 Revised SLERA Report

Notes:
% = Percent
ft = Foot
mg/kg = Milligram per kilogram
ng/kg = Nanograms per kilogram
pci/g = Picocuries per gram
pg/g = Picograms per gram
SLERA = Screening level ecological risk assessment
ug/kg = Microgram per kilogram

Lab Qualifiers
J = Indicates an estimated value.
J+ = Indicates an estimated value with a positive bias.
J- = Indicates an estimated value with a negative bias.
< Below sample quantitation limit
UJ = The analyte was analyzed for and was not present above the level of the associated value.

APPENDIX C-2
LIST OF CHEMICALS FOR WHICH NAMES AND/OR CASRN WERE STANDARDIZED FOR SLERA PROCESS

Table C-2 List of Chemicals for which Names and/or CASRN were Standardized for SLERA Process

TABLE C-2: List of Chemicals for which Names and/or CASRN were Standardized for SLERA Process
Nevada Environmental Response Trust Site
Henderson, Nevada

Method Group	Original Chemical Name	Original CASRN	Standardized Chemical Name	Standardized CASRN	Changes	Notes
General Chemistry	Ammonia (as N)	7664-41-7|0	Ammonia	7664-41-7	Name and CAS Changed	Converted to NH3 basis using ratio of 1.22
General Chemistry	Ammonia (as NH3)	7664-41-7|1	Ammonia	7664-41-7	Name and CAS Changed	
General Chemistry	Nitrate (as N)	14797-55-8_N	Nitrate	14797-55-8	Name and CAS Changed	Converted to NO3 basis using ratio of 4.43
General Chemistry	Nitrate (as NO3)	14797-55-8_NO3	Nitrate	14797-55-8	Name and CAS Changed	
General Chemistry	Nitrate Nitrite as N	NO3NO2N	Nitrate/Nitrite	NO3/NO2	Name and CAS Changed	Converted to NO3 basis using ratio of 4.43
General Chemistry	Nitrite (as N)	14797-65-0_N	Nitrite	14797-65-0	Name and CAS Changed	Converted to NO2 basis using ratio of 3.29
General Chemistry	ortho-Phosphate (total) (as P)	11-36-9P	ortho-Phosphate	11-36-9	Name and CAS Changed	Converted to PO4 basis using ratio of 3.07
General Chemistry	ortho-Phosphate (total) (as PO4)	11-36-9PO4	ortho-Phosphate	11-36-9	Name and CAS Changed	
Metals	Uranium (total)	U-Total	Uranium (total)	7440-61-1	CAS Changed	
Metals	Uranium (total, natural)	U-nat tot	Uranium (total)	7440-61-1	Name and CAS Changed	
RAD	Lead-210	14255-04-0	Lead-210	Pb-210	CAS Changed	
RAD	Lead-212	15092-94-1	Lead-212	Pb-212	CAS Changed	
RAD	Uranium-233/234	U-233/234	Uranium-234	U-234	Name and CAS Changed	
RAD	Uranium-235/236	U-235/236	Uranium-235	U-235	Name and CAS Changed	
TPH	Diesel Range Organics (C10-C28)	DRO (C10-C28)	Total petroleum hydrocarbon-diesel	TPH-diesel	Name and CAS Changed	
TPH	Diesel Range Organics (C13-C22)	DRO (C13-C22)	Total petroleum hydrocarbon-diesel	TPH-diesel	Name and CAS Changed	
TPH	Gasoline Range Organics (C4-C12)	GRO (C4-C12)	Total petroleum hydrocarbon-gasoline	TPH-gasoline	Name and CAS Changed	
TPH	Gasoline Range Organics (C6-C10)	GRO (C6-C10)	Total petroleum hydrocarbon-gasoline	TPH-gasoline	Name and CAS Changed	

Notes:

CAS or CASRN = Chemical Abstracts Service Registry Number

N = Nitrogen

NH3 = Ammonia

P = Phosphorous

PO4 = Phosphate

RAD = Radionuclide compounds

SLERA = Screening level ecological risk assessment

TPH = Total petroleum hydrocarbons

Table C-3: Summary of Soil Data Excluded During Data Processing
Nevada Environmental Response Trust Site
Henderson, Nevada

Notes:

-- = data not provided.
CASRN = Chemical Abstract Service Registration Number
DU = Ecological Decision Unit
EPA = Environmental Protection Agency
FD = Field duplicate
ft bgs = feet below ground surface
g = gram
J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
kg = kilogram
mg = milligram
N = Normal
OU-1 = Operable Unit 1
UJ = The nondetected analyte was qualified as estimated at the sample quantitation limit. The reported sample quantitation limit is approximate and may be inaccurate or imprecise.

DU = Ecological Decision Unit
mg/kg = milligram per kilogram
l = Qualified due to laboratory control spike recoveries
m = Qualified due to matrix spike recoveries
r-m = Rejected due to matrix spike recoveries
i = Qualified due to internal standard areas
r-c = rejected due to calibration
r-h = Rejected due to holding time exceedance
r-p = rejected as a false positive due to contamination during shipping
R = Rejected value
s = Qualified due to surrogate recoveries

Notes:
-- = result value not revised
mg/kg = milligram per kilogram
ng/kg = nanogram per kilogram
pCi/g = picoCurie per gram
pg/g = picogram per gram
ug/kg = microgram per kilogram
DU = Ecological Decision Unit
N = Not detected
Y = Detected
J = The result is an estimated quantity. the associated numerical value is the approximate concentration of the analyte in the sample.
JK = The result is an estimated maximum possible concentration (dioxins and PCB congeners)
K = Qualified as estimated maximum possible concentration (dioxins and PCB congeners)
PCB = Polychlorinated biphenyl
U = Not detected
UJ = The nondetected analyte was qualified as estimated at the sample quantitation limit. The reported sample quantitation limit is approximate and may be inaccurate or imprecise.

Data Usability Criterion *(description of criterion)*	**Evaluation Result**
I. Reports to the Risk Assessor *List all reports and dates and confirm that report(s) relied upon are complete and appropriate for use in the OU-1 Refined Screening Level Ecological Risk Assessment (SLERA)*	The work plans, reports, and Data Validation Summary Reports (DVSRs) for soil investigations completed within the OU-1 Refined SLERA Area are reported in the following documents. **Historical Investigations** *Upgradient Investigation (March 2006)* • Upgradient Investigation Work Plan Addendum (ENSR 2006a, approved by Nevada Division of Environmental Protection [NDEP] on February 22, 2006) • Upgradient Investigation Results (ENSR and AECOM 2006) • Data Validation Summary Report, Document No. 04020-023-152 and Associated Electronic Data Deliverable (EDD), Upgradient Investigation (Ramboll Environ 2017a, approved by NDEP on November 16, 2017) *Phase A Investigation (between November 1 and December 8, 2006)* • Phase A Work Plan (ENSR 2006b, approved by NDEP on October 26, 2006) • Phase A Source Area Investigation Results Report (ENSR 2007a, approved by NDEP on November 30, 2007) • Phase A DVSR (ENSR 2007b, approved by NDEP on December 17, 2007) *Phase B Investigation (between June 11 and July 11, 2008 and between June 2 and November 5, 2009)* • Phase B Work Plan Areas I-IV (AECOM 2008, approved by NDEP on January 16, 2009) • (A Phase B investigation results report was not identified.) • DVSR, Phase B Investigation Area I Soil (Northgate 2010a, approved by NDEP on January 20, 2010) • DVSR, Phase B Investigation Area II Soil (Northgate 2010b, approved by NDEP on February 18, 2010) • DVSR, Phase B Investigation Area III Soil (Northgate 2010c, approved by NDEP on March 17, 2010) • DVSR, Phase B Investigation Area IV Soil (Northgate 2010d, approved by NDEP on March 29, 2010)

TABLE C-6: Data Usability Evaluation Summary

Nevada Environmental Response Trust Site

Henderson, Nevada

	Phase B Supplemental Investigation (between December 9 and December 22, 2009) • Phase B Scope for Additional Sampling Area I (Northgate 2009a, approved by NDEP on November 24, 2009) • Phase B Scope for Additional Sampling Area II (Northgate 2009b, approved by NDEP on December 11, 2009) • (A Phase B supplemental investigation results report was not identified.) • DVSR, Phase B Shallow Soil Supplemental Sampling Areas I and II (Neptune 2010, approved by NDEP on July 28, 2010) *Soil Removal Pre-Confirmation Sampling (between April 6 and November 12, 2010)* • Pre-Confirmation Sampling Work Plan (Northgate 2010e, approved by NDEP on March 30, 2010; A pre-confirmation sampling results report was not identified.) • DVSR, Pre-Confirmation Sampling Remediation Zone B (Northgate 2010f, approved by NDEP on August 20, 2010) • DVSR, Pre-Confirmation Sampling Remediation Zone C (Northgate 2010g, approved by NDEP on September 1, 2010) • DVSR, Pre-Confirmation Sampling Remediation Zone D (Northgate 2010h, approved by NDEP on October 8, 2010) • DVSR, Pre-Confirmation Sampling Remediation Zone E (Northgate 2010i, approved by NDEP, an approval letter was not identified[1]) • DVSR, Additional Pre-Confirmation Sampling (Northgate 2011, approved by NDEP on February 21, 2013) *Confirmation and Completion Sampling for the Soil Removal Action (between February 9 and August 31, 2011)* • Confirmation Soil Sampling Work Plan (ENVIRON 2011, approved by NDEP on May 12, 2011) • Interim Soil Removal Action Completion Report (ENVIRON 2012, approved by NDEP on December 17, 2012) • DVSR, Revision 4, February to August 2011 Soil Remediation Completion Sampling (Laboratory Data Consultants 2013, approved by NDEP on February 14, 2014)

[1] NDEP provided two minor comments on this DVSR on August 26, 2010, and Northgate resubmitted the DVSR and the electronic data deliverable on September 9, 2010 and October 11, 2010. The data from this DVSR were uploaded to the BMI database. Therefore, it is assumed that this DVSR was approved.

	Samples not included in the above investigations Samples at three locations (TSB-GJ-03, TSB-GJ-04, and TSB-GR-02), collected as part of the investigations of Parcels C, D, F, G, and H, map within the OU-1 Refined SLERA Area. These samples are now included in the OU-1 Refined SLERA Area data set. **Remedial Investigations** *Phase 1 Remedial Investigation (RI) (between October 23 and December 18, 2014) and Phase 2 RI (between February 22 and June 30, 2017)* • RI and Feasibility Study Work Plan (ENVIRON 2014a, approved by NDEP on July 2, 2014) • RI Data Evaluation Technical Memorandum (Ramboll Environ 2016, approved by NDEP on July 13, 2016) • OU-1 and OU-2 Remedial Investigation Report (Ramboll 2021a, under NDEP review) • DVSR, October through December 2014 Soil Remedial Investigation Sampling (Ramboll 2019a, approved by NDEP on May 30, 2019) • DVSR, Phase 2 Remedial Investigation, February through June 2017 Data (Ramboll 2019b, approved by NDEP on July 10, 2019) • DVSR, Phase 2 Remedial Investigation, March 2018 through March 2019 Data (Ramboll 2020a, approved by NDEP on April 9, 2020) **Soil Removal Action of Dioxin-Impacted Soil Near GW-11 Pond** • Work Plan and Soil Management Plan (SMP)-Required Contingency Plan, Pre-Excavation Sampling for Dioxin Soil Remediation (Ramboll 2018, approved by NDEP on August 24, 2018) • Soil Excavation Work Plan, SMP-Required Notifications and Contingency Plan – Dioxin Soil Remediation Area (Ramboll 2019c, approved by NDEP on January 14, 2019) • Report of Soil Removal Action, Dioxin Soil Remediation Area (Ramboll 2020b) • DVSR, Dioxin Impacted Soil Removal Action (Ramboll 2019d, approved by NDEP on December 19, 2019)

TABLE C-6: Data Usability Evaluation Summary

Nevada Environmental Response Trust Site

Henderson, Nevada

	Overall, the available reports, and the accompanying laboratory reports and DVSRs, are considered complete for the OU-1 Refined SLERA purposes.
II. Documentation *Confirm that each analytical result is associated with a specific sample location and that the appropriate sampling procedure is documented.*	For this step, Ramboll reviewed the soil samples collected and reported in the documents listed under Criterion I and/or in the NERT project database. The following steps were then completed (presented in chronological order): • Identification of "removed" samples and re-assignment of sample depths: Following the manganese tailings and soil removal actions and the remediation of dioxin-impacted soil near GW-11 Pond, samples that had been collected within an excavated area were tagged in the Nevada Environmental Response Trust (NERT) project database as "removed." The "remaining" samples were reviewed, as follows: for each sample, the sample location and depth (as reported in the original investigation) were reviewed and the top and bottom depths were re-assigned, as needed, to reflect the post-excavation depth. The re-assignment was necessary because not all excavated areas were backfilled to original grade. For example, a sample with a pre-excavation top depth of 10 feet below ground surface (bgs) in an area for which soil was excavated to 8 feet bgs and then backfilled with five feet of clean soil, was reassigned a top depth of 7 feet bgs. • The geographic location of each "remaining" sample was confirmed relative to the current boundaries of the Operations Area, Excavation Control Areas (ECAs), and parcels. Samples located outside the OU-1 Refined SLERA Area were removed from the OU-1 Refined SLERA data set, and samples collected as part of a parcel investigation but actually located within the OU-1 Refined SLERA Area were added to the OU-1 Refined SLERA data set. • Confirmation of sampling procedures: As discussed in the work plans listed under Criterion I, all sample collection and handling procedures were consistent with the NDEP-approved Quality Assurance Project Plan (QAPP) (ENSR 2008, AECOM and Northgate 2009, ENVIRON 2014b, Ramboll Environ 2017b). Ramboll reviewed the chain-of-custody forms prepared in the field and compared them with the analytical data results provided by the laboratories to ensure completeness of the data set. The available information is adequate to relate each analytical result retained in the OU-1 Refined SLERA data set to a geographic location, depth interval, and sampling procedure.

TABLE C-6: Data Usability Evaluation Summary

Nevada Environmental Response Trust Site

Henderson, Nevada

III. Data Sources *Confirmation that source areas are adequately sampled and that analytical methods are appropriate to identify COPECs and estimate EPCs.*	**Historical Investigations** Samples were collected in accordance with the work plans listed under Criterion I. Both judgmental and random sampling approaches were followed, with judgmental samples collected at Letter of Understanding areas (LOUs) that had been identified as source areas. Following each investigation, results were reviewed in consultation with NDEP and areas for additional sampling were identified. As part of the work plans and the QAPPs, the use of standard United States Environmental Protection Agency (USEPA) analytical methods (listed under Criterion IV) was approved by NDEP. Analyses were conducted by NDEP-certified laboratories for the classes of chemical compounds identified as site related chemicals, including chlorine oxyanions (chlorate and perchlorate), metals and other inorganics, radionuclides, dioxins/furans, organic acids, PCBs, OCPs, OPPs, SVOCs (including PAHs), and VOCs. **Remedial Investigation** As part of the ongoing RI/FS (ENVIRON 2014a, Ramboll Environ 2016, Ramboll 2021a), surface and subsurface soil samples were collected at the Site during Phase 1 and Phase 2 RI to address spatial data gaps identified through the review of available historical soil and groundwater data. Review of the analytical results indicates that these spatial data gaps have been addressed. The specific analyses conducted (chlorine oxyanions, metals and other inorganics, volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), organochlorine pesticides (OCPs), organophosphate pesticides (OPPs), polychlorinated biphenyls (PCBs), dioxins/furans, organic acids, and radionuclides) were identified based on the review of the historical sampling results. Analyses with standard USEPA analytical methods (listed under Criterion IV) were conducted by NDEP-certified laboratories. In summary, the review of sampling coverage from the refined SLERA data set is based on the distribution of sample locations from both historical and recent investigations. Sample coverage is considered adequate for purposes of the refined SLERA. The USEPA analytical methods are adequate for characterizing potential contaminants in soils and provide quantitative analytical results that are of adequate quality for deriving environmental point concentrations (EPCs).

TABLE C-6: Data Usability Evaluation Summary

Nevada Environmental Response Trust Site

Henderson, Nevada

IV. Analytical Methods and Detection Limits *Confirm that analytical methods appropriately identify the chemical form or species and that the sample quantitation limit (SQL) is at or below a concentration appropriate for the OU-1 Refined SLERA.*	Standard analytical methods were used for all analyses as listed below. **Historical Investigations** • USEPA Method 6020 or 6010 (metals) • USEPA Method 7199 or 7196A (chromium VI) • USEPA Method 7471 (mercury) • USEPA Method 350.1 (ammonia) • USEPA Method 9056 or 300 (bromide, chloride, nitrate, ortho-phosphate, sulfate) • USEPA Method 365.1 or 6020 (phosphorus) • USEPA Method 9056, 300 or 300.1 (chlorate) • USEPA Method 9012A (cyanide [total]) • USEPA Method 300.1 (chlorite) • USEPA Method 300 (fluoride) • USEPA Method 9056 or 353.2 (nitrite) • USEPA Method 314.0 (perchlorate) • USEPA Method 8081 (OCPs) • USEPA Method 8082 (PCB Aroclors) • USEPA Method 1668A (PCB congeners) • USEPA Method 8290 or 8290 Screen (dioxins/furans) • DOE EML HASL 300 (Thorium [Th], Uranium [U]) • DOE EML HASL 300, USEPA Method 901.1, or USEPA Method 903.1 (Radium-226 [Ra-226]) • DOE EML HASL 300, USEPA Method 901.1, or USEPA Method 904.0 (Radium-228 [Ra-228])

	• USEPA Method 8141A (OPPs) • USEPA Method 8151 (herbicides) • USEPA Method 8260 (VOCs) • USEPA Method 8270 SIM or 8270 (SVOCs, including polycyclic aromatic hydrocarbons [PAHs]) • USEPA Method 8315A (formaldehyde) • HPLC-UV per Alpha (organic acids) **Remedial Investigation** • USEPA Method 6020 or 6010 (metals) • USEPA Method 7199 (chromium VI) • USEPA Method 7471 (mercury) • SM 4500 (ammonia) • USEPA Method 300 (bromide, chloride, nitrate, nitrite, ortho-phosphate, sulfate) • USEPA Method 300.1 (chlorate) • USEPA Method 314.0 (perchlorate) • USEPA Method 8081 (OCPs) • USEPA Method 8082 (PCB Aroclors) • USEPA Method 1668A (PCB congeners) • USEPA Method 8290 (dioxins/furans) • DOE EML HASL 300 (Th, U) • USEPA Method 903.0 (Ra-226) • USEPA Method 904.0 (Ra-228)

	• USEPA Method 8141A (OPPs) • USEPA Method 8260 (VOCs) • USEPA Method 8270 or 8270 SIM (SVOCs, including PAHs) • USEPA Method 8270 (organic acids) The above methods are acceptable to characterize the corresponding chemical groups in soil. The SQLs for analytes that were not detected in any samples were evaluated to confirm that they were sufficiently low for risk characterization (i.e., below ecological screening values [ESVs]). There were 171 analytes that were not detected in the OU-1 Operations Area dataset. Of these analytes, 74 had ESVs. For Parcel E, there were 175 analytes that were not detected, with 100 of these having ESVs. The evaluation of these non-detected chemicals against relevant ESVs is provided in Appendix J of the OU-1 Refined SLERA Report and discussed in the uncertainty section.
V. Data Review *Confirm that the quality of the analytical data is assessed by professionals knowledgeable in field collection procedures and analytical chemistry and that data quality is adequate to estimate EPCs.*	The laboratory results from historical investigations and the RI, were subjected to formal data validation consistent with USEPA guidelines (USEPA 1999, 2001, 2004, 2005a,b, 2008, 2009), the Black Mountain Industrial (BMI) Plant Site Specific Supplemental Guidance on Data Validation (NDEP 2009a), and Basic Remediation Company (BRC) Standard Operating Procedure (SOP) 40 and Data Review/Validation (BRC 2009). The USEPA guidelines, which were prepared for Contract Laboratory Program data, were adapted to reflect the analytical methods and measurement quality objectives established for the individual sampling events and NDEP guidance. The NDEP-approved DVSRs listed in Criterion I for soil data are available upon request and have been presented in prior risk assessments (e.g., Ramboll 2020c [Parcel E HRA], Ramboll 2021a [OU-1/OU-2 RI] and Ramboll 2021b *In Progress* [OU-1 Soil BHRA]). The DVSRs provide the names and qualifications of the reviewers, the specific data validation procedures, and the qualification findings. Each DVSR includes the following tabular summaries of the data qualifications: • Summary of data qualified due to holding time exceedances • Summary of data qualified due to detection below quantitation limit • Summary of data qualified due to laboratory blank contamination • Summary of data qualified due to field blank contamination • Summary of data qualified due to matrix spike (MS)/matrix spike duplicate (MSD) recovery exceedances

TABLE C-6: Data Usability Evaluation Summary

Nevada Environmental Response Trust Site

Henderson, Nevada

	• Summary of data qualified due to laboratory control spike (LCS) recovery exceedances • Summary of data qualified due to field/laboratory duplicate • Summary of data qualified due to surrogate recovery exceedances • Summary of data qualified due to calibration violations • Summary of data qualified due to calibration range exceedances • Summary of data qualified due to internal standard recovery exceedances • Summary of data qualified due to serial dilutions • Summary of qualified data results • Summary of rejected data results These data qualifications are further discussed below as a component of Criterion VI.
VI. Data Quality Indicators (DQI) *Document that sampling and analysis DQIs are evaluated using criteria specific to the risk assessment.*	<u>Completeness</u> Completeness is defined as the percentage of acceptable sample results compared to the total number of sample results, which is evaluated to determine if an acceptable amount of usable data were obtained so that a valid scientific site assessment can be completed. The completeness goal stated in the QAPPs is 90% or greater. Completeness was reviewed as reported in the DVSR prepared for each individual investigation contributing to the refined SLERA data set. 99.9% completeness was achieved based on validated data, with 0.1% of the data qualified as rejected ("R" qualified). Rejected ("R" qualified) data associated with post-remediation soil samples with a starting depth less than 1-foot bgs in the Area are summarized in Appendix C, Table C-4. In summary, the completeness for the OU-1 Refined SLERA soil data meets the goal of 90% established in the QAPPs. Rejected data are excluded from the OU-1 Refined SLERA data set. Given the small percentage of rejected data, the removal of these results is not expected to have a significant impact on the spatial coverage of the OU-1 Refined SLERA data set.

Comparability

Comparability is a qualitative characteristic expressing the confidence with which one data set can be combined with another for purposes of estimating exposure. More specifically, comparability is a qualitative expression of the measure of confidence that two or more data sets may contribute to a common analysis. In general, comparability of data is maximized by using standard methods for sampling and analysis, reporting data, and data validation.

Soil samples identified for the refined SLERA were collected by different entities and analyzed by different analytical laboratories (and in some cases, different analytical methods were used for the same analyte); overall, the investigations from which data are being used span a period of more than 12 years. Different reporting limits for the same analyte may also impact the comparability of the data sets. SQLs for each analyte that were not detected in any sample but have ESVs are presented in Appendix J[2]. For most of the analytes, the SQLs are well below the ESV; therefore, different reporting limits for the same analyte would not affect the overall risk evaluation. There are a few analytes with SQLs exceeding ESVs, and their impacts on the overall risk evaluation are further discussed in the uncertainty section.

Of particular concern are possible differences between the refined SLERA data set and the BRC/Titanium Metals Corporation (TIMET) regional background soil data set (BRC and TIMET 2007) for both metals and radionuclides as a result of different sample preparation methods, modified (or different) analytical methods, and possible systematic differences among the internal laboratory SOPs. For example, the Operations Area quartile to quartile (Q-Q) plots for beryllium, palladium, phosphorus (total), and zirconium indicate that Operations Area concentrations are generally less than background (Appendix E, Figure E-2c). These observations indicate possible differences in the data sets, possibly associated with sample extraction, analytical methods, or other less-identifiable differences across the SOPs used by the different laboratories. For radionuclides, such issues were even more obvious, and may be important factors in explaining some of the radionuclide data anomalies. BRC/TIMET regional background samples were collected and analyzed in 2005 (before NDEP issued guidance for evaluating radionuclide data [NDEP 2009b]), while the refined SLERA dataset samples were collected and analyzed between 2006 and 2018, i.e., both before and after NDEP issued guidance for evaluating radionuclide data [NDEP 2009b]). Over this time period, samples were submitted for analysis to different analytical laboratories and analyzed using different preparation and analytical methods.

Representativeness

Representativeness is the degree to which data accurately and precisely represent a characteristic of the population at a sampling point or an environmental condition. There is no standard method or formula for evaluating representativeness, which is a qualitative term. Spatial representativeness is achieved through selection of sampling locations that are appropriate relative to the objective of the specific investigation, and by collection of an adequate number of samples from locations identified in relation to the investigation objectives. Concentration representativeness is achieved by obtaining analytical results of sufficient quality, as specified in the QAPPs.

	Spatial representativeness was discussed previously under Criterion III. As noted, both judgmental and random sampling approaches were followed, with judgmental samples collected at LOUs that had been identified as source areas, ensuring that the post-excavation data provide a conservative representation of current conditions within the OU-1 Refined SLERA Area in the context of the conceptual site model (CSM). The objectives of the sampling programs were met, considering the phased approach used to delineate contaminated areas. As presented in the DVSRs listed under Criterion I, standard methods for sampling and analysis were used for all the investigations, which confirmed that the analytical data are representative of the soil concentrations at the locations sampled. <u>Precision</u> Precision is a measure of the degree of agreement between replicate measurements of the same source (field precision) or sample (analytical precision). Field precision is evaluated by calculating the relative percent difference (RPD) between the primary field sample and its field duplicate. Laboratory precision is quantitated for each laboratory data batch by calculating the RPD using data for the laboratory control spike/laboratory control spike duplicate and/or data for the matrix spike/matrix spike duplicate. The field precision goal established in the QAPPs is a RPD of less than or equal to 50%, except for the case in which one (or both) of the primary or duplicate result is less than five times the PQL. For the latter case, the acceptance criteria is the PQL (i.e., the absolute value of the difference between the primary and duplicate result is less than or equal to the PQL). Laboratory precision goals are defined for specific analytical methods, as indicated in the QAPP (see Table 2 of ENVIRON [2014b]). <u>Accuracy</u> Accuracy measures the level of bias that an analytical method or measurement exhibits. Both field accuracy and laboratory accuracy are evaluated under this DQI. Accuracy in the field is assessed through the use of trip and equipment blanks and through adherence to all sample handling, preservation, and holding time requirements. As specified in the QAPPs, the objective for trip and equipment blanks is for no analyte to be present at levels greater than the practical quantitation limit (PQL). Accuracy in the laboratory analytical data is a measure of the overestimation or

[2] Based on NDEP (2008), the uncensored data for radionuclides were used in the OU-1 Refined SLERA; therefore, the detection frequency for radionuclides is 100% and radionuclide data are not included in Appendix J.

	underestimation of reported concentrations. Several quality control (QC) parameters are used to evaluate the accuracy of reported analytical results, including: • Holding times; • Field and laboratory blanks; • Matric spike/Matrix spike duplicate percent recovery; • Surrogate spike recovery; and • Laboratory control spike/Laboratory spike duplicate percent recovery. All data used in the OU-1 Refined SLERA and associated qualifiers (i.e., U, J, J-, and J+) are presented in Appendix D, Table D-1, and the reasons for these data qualifiers are summarized in the DVSRs. Although laboratory limits were exceeded for certain compounds or analyses, as identified by the laboratory (and confirmed during data validation), there does not appear to be a systematic or widespread impact on the quality of the analytical results. Furthermore, based on a review of the laboratory narratives (provided in the laboratory reports in each DVSR), the laboratory does not believe that the observed exceedances of laboratory criteria are a cause for concern. Therefore, the qualified data are determined to be usable and valid for purposes of the OU-1 Refined SLERA and are included in the OU-1 Refined SLERA data set. Data collected before 2012 and associated with field and laboratory blank contamination were originally qualified as nondetected values based on the NDEP guidance at that time. As requested by NDEP and in accordance with the most recent guidance (NDEP 2012) for evaluating data associated with blank contamination, where possible, Ramboll queried the censored data for blank contamination from the project database, and changed them from nondetected values (U qualified) to detected values at reported concentrations (J qualified), if there were detections between the SQL and the PQL. The revisions of censored data for blank contamination are summarized in Appendix C, Table C-5. Ramboll evaluated the data and determined that the impacts on overall risk due to blank contamination is minimal. In summary, with the exception of the rejected data, all data are acceptable through the DQI evaluation and deemed to be usable for risk assessment purposes.
