RE: Las Vegas Wash Seep Interim Measures Report

Dear Mr. Dong:

The Nevada Environmental Response Trust (NERT) has prepared this Interim Measures Report as requested in your March 17, 2015 e-mail. In accordance with your request, this report summarizes the interim measures that were implemented at the seep sump adjacent to the Las Vegas Wash. This letter summarizes the activities conducted to date by NERT to capture groundwater discharging from the groundwater seep and future plans to contain water that has accumulated at the seep sump.

Introduction

On February 4, 2015 the Nevada Division of Environmental Protection Bureau of Corrective Actions (NDEP-BCA) notified NERT that the seep sump along the Las Vegas Wash was full of water and was no longer preventing accumulated water from flowing to the area east of the sump. This sump was constructed by Kerr-McGee Chemical Corporation (KMCC) to contain and manage groundwater seeping to the surface. Upon inspection by NERT on February 4, 2015, groundwater appeared to be discharging to the surface, contained by the existing seep sump structure, but spilling out of the eastern side of the sump at a rate of approximately 1.5 gallons per minute (gpm). At the request of NDEP-BCA, NERT devised and implemented a plan to investigate and prevent, if feasible, groundwater from escaping this area.

The groundwater seep was discovered in 1999 by the Southern Nevada Water Authority on the south side of the Las Vegas Wash. At the time of discovery, the groundwater seep was flowing at approximately 400 gpm and contained perchlorate at concentrations over 100 mg/L. KMCC constructed the seep sump in 1999 to contain the water before it drained to the Las Vegas Wash in accordance with a 1999 Consent Agreement with NDEP-BCA. The seep sump consists of a sheet pile dam and steel drainage sump constructed to facilitate pumping of accumulated water. Water was pumped from the sump to a temporary IX treatment system located near Lift Station #1. According to Ed Kirsh, the seep sump was operated by KMCC until approximately May 2007. At that time, the groundwater seep stopped discharging to the surface. Although this area had been overgrown with vegetation, people familiar with the sump do not recall water accumulating in this area since KMCC ceased operations at the sump.

Interim Measures

Initially NERT responded by inspecting the seep sump structure, surrounding area and collected two surface water samples from the accumulated water within the sump structure itself and the upgradient ponded water.

These activities were intended to evaluate whether the source of water was the groundwater seep. The actual seep was not visible given the density of the vegetation in the area. The two surface water samples contained perchlorate at concentrations of 950 ug/L from within the sump structure and 894 ug/L at a location approximately 15 feet to the southwest (upgradient) of the sump. Both samples were analyzed by Envirogen Technologies Inc. using their onsite laboratory. Based on visual observations and the analytical data, NERT concluded that the accumulated water was groundwater seeping to the surface.

After the initial inspection of the seep sump area, NERT proposed the following interim measures to eliminate the discharge of standing water from the sump:

1. Removal of water from the seep sump and the adjacent area west (upgradient) of the sump using a vacuum truck. This action was intended to immediately stop the flow of accumulated water from the area. The existing dam and sump system will be utilized in the same manner as it was originally designed to complete this task.
2. Increase the pumping rate in extraction wells PC-133, PC-117, PC-116R, and PC-99R2/R3 located at the east end of the Seep Well Field (SWF). These wells are closest to the seep area and had additional extraction capacity. This action was designed to lower the water table in this area and assist in reducing the potential for future seepage in the sump area.
3. Measure water levels in monitoring wells PC-96, PC-97, and WMW-6.15S to evaluate the elevation of shallow groundwater and the effectiveness of the modified pumping scenario.

These interim measures were implemented beginning on Friday, February 6, 2015. Initially, a vacuum truck was mobilized to the seep sump and standing water was removed. NERT pumped approximately 8,700 gallons of water from the sump area until all accumulated water had been removed from the sump itself and the upgradient pool had been reduced to approximately 2 inches of standing water. It was evident at this time that the source of the water was coming from an upgradient seep rather than the sump itself (which had been drained to greater than 4 feet below the rim of the sump structure). This effort immediately stopped the flow of water out of the sump structure into the adjacent low-lying area east of the sump. All water removed from the seep area was transferred to NERT's onsite equalization pond GW-11 (GW-11) such that it could be treated in a manner consistent with groundwater extracted from the SWF. Inspection of the seep sump the following day indicated that the water level within the area had rebounded to nearly the previous day's elevation and that continued manual pumping of the area using a vacuum truck would not serve as a cost effective long-term solution. After consultation with NDEP-BCA on February 7, 2015, the decision was made to focus on depressing the water table through increased pumping at the SWF.

The groundwater extraction rate for the SWF was increased on February 6, 2015 to minimize the volume of groundwater seeping to the surface in this area. Table 1 summarizes the groundwater extraction rates for the individual wells in the SWF. Groundwater extraction rates are controlled using ball valves on a pipe rack adjacent to Lift Station #1. The cumulative groundwater extraction rate for the SWF was initially set at the maximum rate that the pump in Lift Station #1 could convey back to GW-11. Individual pumping rates varied during the first week of pumping as the water table was depressed (Table 1). The flow rate was adjusted using the existing ball valves which prevented precise control of the flow rates but served the general purpose.

NERT monitored the water table elevation adjacent to the seep sump area by collecting data from monitoring wells PC-96 and PC-97. Well WMW-6.15S is owned by SNWA and was locked. Due to physical access constraints NERT focused on the two monitoring wells under our control. Depth to water measurements in PC-96 (Figure 1) were obtained manually using a water level indicator; however, a pressure transducer/data logger was installed in PC-97 to collect depth to water measurements every minute for six days (Figure 2). The depth to water measurements and corresponding water table elevations are presented in Table 2. As expected, the water table was depressed by an increase in the groundwater extraction rate of the SWF. The data in Table 2 and Figures 1 and 2 display a relatively steady decrease in groundwater elevation over time.

Figure 1 – Groundwater Elevation in PC-96

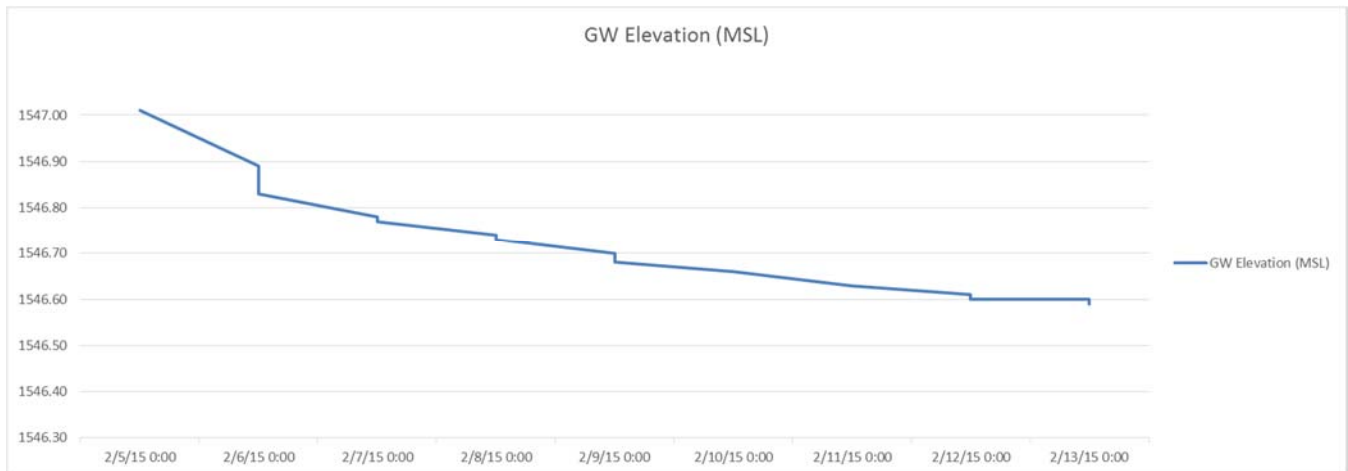

Figure 2 – Groundwater Elevation in PC-97

Well PC-96 was situated closest to the wells within the SWF that were extracting the greatest quantity of groundwater. As indicated in Table 2 and Figure 1 the groundwater elevation decreased with time. Data from well PC-97 displayed more variability in groundwater elevation over time as illustrated in Figure 2. This variability has not been investigated or evaluated given that the goal of this interim measure was to lower the water table elevation, not complete a detailed aquifer analysis. Well PC-97 is located closer to the seep sump but further from the extraction wells in the SWF that produce the greatest quantities of water. Nevertheless, the water table elevation also dropped over time in this well. Direct observations of the water levels in the seep sump indicated that water ceased overtopping the sump on February 10, 2015, after 4 days of increased pumping. After one month of continuous pumping, the water level in the sump had dropped a total of 3 inches below the seep sump rim elevation. As such, the interim measures were successful in achieving the objective of eliminating the groundwater seep from discharging to the Las Vegas Wash.

Approximate Groundwater and Perchlorate Mass Removed From The Seep Area

Groundwater extraction rates are recorded and averaged over every month as part of the NERT Groundwater Extraction and Treatment System (GWETS) Monthly Reporting program. Using February's average SWF extraction rate of 596 gpm, approximately 24,000,000 gallons of groundwater were removed during the month from the SWF. Based on routine samples collected by NERT from each extraction well in the SWF, perchlorate was detected at an average concentration of 11 mg/L. Groundwater samples are collected from each well at

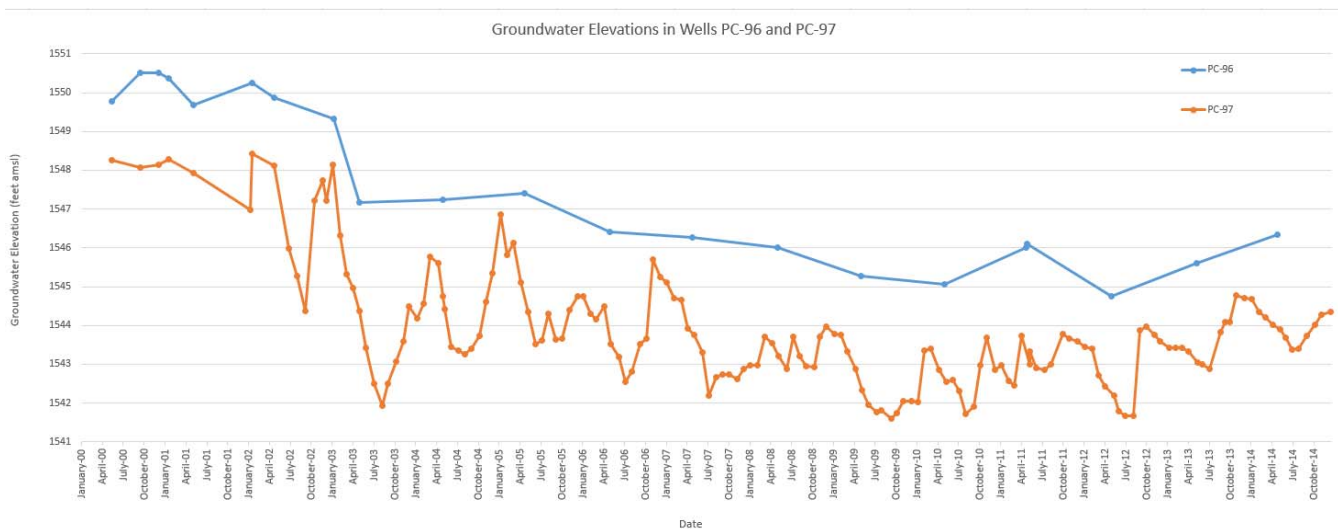

sampling ports located within the fenced enclosure surrounding Lift Station #1. As such, approximately 2,221 pounds of perchlorate were removed by the SWF in February (3 percent increase over January 2015). Based on information collected to date in March (through March 18, 2015), the average extraction rate is 641 gpm and the perchlorate concentration is 12 mg/L. Based on this information, approximately 16,000,000 gallons of groundwater was extracted and 1,314 pounds of perchlorate has been removed by the SWF through March 18, 2015.

Summary

As indicated in this report, the interim measures implemented by NERT were successful in containing water that accumulated at the seep sump and preventing its flow to the Las Vegas Wash. NERT has continued the increased pumping rate of the SWF since early February and we continue to see a reduction in the water level within the seep sump (approximately 4-inches below the rim of the sump as of the preparation of this report).

The NERT believes the recent presence of accumulated water at the seep sump and adjacent areas is the result of seasonal changes in the water table elevation, and perhaps to a lesser extent, the result of tamarisk removal actions in recent years. This invasive vegetation may have helped to remove shallow groundwater in this area through evapotranspiration processes and reduced the likelihood of groundwater seeping to the surface. Based on historical data from monitoring wells PC-96 and PC-97, the water table elevation routinely drops during the summer months and rises again in the winter (Figure 3). However, data from well PC-97 (located closest to the seep sump) indicates that groundwater was at its highest elevation since seep sump pumping operations ceased between the periods of November 2013 to April 2014 and again in November 2014 until the extraction rate was increased in February 2015.

Figure 3 – Historical Groundwater Elevation Data for PC-96 and PC-97

Due to the current hydraulic limitations of various GWETS components and the upcoming launch of the NERT GWETS Continuous Optimization Program (COP), the NERT desires to discontinue this interim measure and reduce the SWF extraction rate back to the previously established rates in place prior to February 2015.

The NERT will continue to monitor the water levels in the seep sump and general conditions in the seep sump area and provide updates to NDEP-BCA within the monthly COP reporting to begin in May 2015. Furthermore, and as part of the COP, the NERT will conduct various GW model refinements to determine what SWF extraction rate is appropriate to minimize future loading to the Las Vegas Wash yet maximize mass removal within the NERT plume.

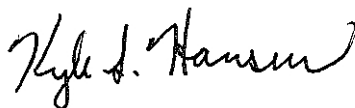

Upon approval by NDEP-BCA, NERT will discontinue this interim measure and will facilitate all future modifications of the SWF extraction rates through the COP.

Should you have any additional questions, please feel free to contact the undersigned.
