Subject: Las Vegas Wash Bioremediation Pilot Study Monthly Progress Report

At the direction of the Nevada Environmental Response Trust (NERT or Trust), Tetra Tech, Inc. (Tetra Tech) has prepared this memorandum which summarizes Tetra Tech's progress during April 2021 toward successfully implementing the Las Vegas Wash Bioremediation Pilot Study.

Task Progress Update: April 2021

Task M19 – Las Vegas Wash Pilot Study

- Current Status
 - Injections – The first injection event was completed in December 2020 and included injections into all three pilot study zones (Zone 1, 2, and 3) within the alluvium and/or Upper Muddy Creek formation (UMCf). A summary of the first injection event was provided in the January 2021 monthly progress report. The second injection event was performed from April 12, 2021 to April 21, 2021 and included injections into only the Zone 2 alluvium. Due to slower groundwater flow rates in the UMCf, the next round of injections into Zones 1, 2, and 3 UMCf will likely not occur until fourth quarter 2021. During the second injection event into the Zone 2 alluvium, all injection wells accepted the targeted design quantity of carbon substrate solution and follow-up distribution water. A layout map and construction details of all injection, monitoring, and extraction wells are provided on Figures 1 through 4 and Table 1. A photographic log of the second injection event is provided in Attachment 1 and details of the second injection event, including a summary of injection rates, pressures, quantities, and specific gravity information are included in Tables 2 through 6 as attachments to this monthly progress report.
 - Effectiveness Monitoring – Baseline groundwater sampling was completed in the fall of 2020 prior to the first injection event. The monitoring program described in the Work Plan Addendum was subsequently implemented to evaluate the effectiveness of in-situ bioremediation. As part of this monitoring program, groundwater sampling was conducted on a biweekly basis for the Zone 2 alluvium for the first two months post-injection and was followed by a monthly sampling program thereafter, which is ongoing. Groundwater sampling for the UMCf and UMCf-coarse grained

(UMCf-cg) in Zones 1, 2, and 3 has been conducted on a monthly basis since the first injection event. Available groundwater analytical results from the baseline sampling event and subsequent effectiveness monitoring events performed from December 2020 to March 2021 (two biweekly sampling events and the first three monthly sampling events following injections) are provided in Table 7. Results from the sampling event conducted three months post-injection (March 2021) are summarized below. Groundwater analytical results from the fourth monthly groundwater sampling event recently conducted from April 5, 2021 through April 15, 2021 will be provided in future monthly progress reports as data become available.

- Zone 2 Alluvium:
 - Groundwater samples collected from cross-gradient monitoring wells LVWPS-A2-MW04A/B and LVWPS-A2-MW05A/B, which are located approximately 17 feet from each end of the Zone 2 injection well transect, continue to exhibit perchlorate concentration decreases ranging from 29 to 99 percent reduction when compared to baseline concentrations. Perchlorate concentrations in groundwater samples collected from LVWPS-A2-MW05B continue to exhibit perchlorate concentrations below detection limits.
 - Groundwater samples collected from the 14 monitoring wells located approximately 50 to 100 feet downgradient of the injection well transect exhibited an overall average percentage decrease in groundwater perchlorate concentrations (compared to baseline concentrations) of 51 percent during the third monthly post-injection sampling event (March 2021). Groundwater samples collected from four of these 14 monitoring wells continue to exhibit perchlorate concentration reductions of greater than 90 percent when compared to baseline. Additionally, groundwater samples collected from LVWPS-A2-MW14A and LVWPS-A2-MW17A/B exhibited the lowest perchlorate concentrations measured to date three months after injections.
 - Groundwater samples collected three months after injection activities from monitoring wells LVWPS-MW208B and LVWPS-MW223B, which are located approximately 200-250 feet downgradient from the injection well transect, continued to exhibit perchlorate concentration decreases of greater than 80 percent when compared to baseline concentrations.
 - Chlorate results followed a similar pattern to perchlorate results for samples collected three months post-injection. Groundwater samples collected from two of the four cross-gradient monitoring wells continued to show decreases in chlorate concentrations of greater than 75 percent compared to baseline. Groundwater samples collected from eight of the 18 monitoring wells located between 50 and 250 feet downgradient from the injection well transect exhibited reductions in chlorate concentration of greater than 75 percent. Groundwater samples collected from six of these eight monitoring wells exhibited concentration decreases greater than 90 percent when compared to baseline.
 - Nitrate concentrations in groundwater were also evaluated because it is often a competing and preferred electron acceptor and carbon substrate consumer. Nitrate concentrations in groundwater samples collected from Zone 2 alluvium monitoring wells averaged 17 milligrams per liter (mg/L) during the baseline sampling event. Since injections began, nitrate concentrations have reduced an average of 56 percent in groundwater samples collected from cross-gradient and downgradient monitoring wells. During the second monthly sampling event, groundwater samples collected from 14 cross-gradient or downgradient

monitoring wells exhibited decreases in nitrate concentrations to less than 10 mg/L. Groundwater samples collected from four of these 14 monitoring wells exhibited nitrate concentrations less than the detection limit of 0.014 mg/L.

- Zone 1, 2, and 3 UMCf/UMCf-cg:
 - Zone 1 UMCf – Approximately three months following injections into Zone 1 UMCf, groundwater samples collected from monitoring wells LVWPS-U1-MW08A and LVWPS-U1-MW08B, which are both located approximately 25 feet downgradient from the injection well transect, indicated perchlorate concentrations below the sample detection limit (less than 0.31 µg/L) and 54 µg/L, respectively. Other notable observations include groundwater samples collected from one monitoring well located 100 feet downgradient from the injection well transect (LVWPS-U1-MW09B), where perchlorate concentrations indicated a reduction of 34 percent compared to baseline conditions three months after the injection event. Lastly, immediately following the first injection event, reductions in perchlorate concentrations were also observed in two upgradient monitoring wells, namely LVWPS-U1-MW06B and LVWPS-U1-MW07, due to the low effective porosity causing injectate solution to move farther from the injection points (both upgradient and downgradient) while injecting under pressure. As expected, three months after the injection event, upgradient perchlorate concentrations continue to increase as the injectate solution has migrated downgradient. Nitrate and chlorate concentrations followed a similar pattern to perchlorate.
 - Zone 2 UMCf – Approximately three months following injections into Zone 2 UMCf, groundwater samples collected from cross-gradient monitoring wells LVWPS-U2-MW04 and LVWPS-U2-MW05, which are screened in the UMCf and located approximately 12 feet from each end of the Zone 2 injection well transect, continue to indicate perchlorate concentrations less than the sample detection limit in both monitoring wells. Additionally, groundwater samples collected from all monitoring wells located 25 to 50 feet downgradient from the injection well transect exhibited slight perchlorate concentration decreases of up to 39 percent when compared to baseline concentrations. Lastly, groundwater samples collected from monitoring well LVWPS-MW223C, which is located approximately 200 feet downgradient from the Zone 2 injection well transect, indicate a perchlorate concentration reduction of approximately 53 percent when compared to baseline, likely indicative of a preferential flow path in this vicinity. Nitrate and chlorate concentrations followed a similar pattern to perchlorate.
 - Zone 3 UMCf-cg – Approximately two months following injections into Zone 3 UMCf-cg, groundwater samples collected from three of the six monitoring wells located approximately 25 feet downgradient exhibited a greater than 89% reduction in perchlorate concentrations compared to baseline. In addition, groundwater samples collected from monitoring wells LVWPS-U3-MW10A/B, which are located approximately 100 feet downgradient from the Zone 3 injection well transect, both exhibited a greater than 99% reduction in perchlorate, chlorate, and nitrate concentrations compared to baseline. Lastly, groundwater samples collected from LVWPS-U2-MW12B, which is located approximately 150 feet downgradient, continued to indicate decreasing perchlorate, chlorate, and nitrate concentrations two months after injections, with concentration decreases of greater than 78 percent when compared to baseline for all three analytes.

These observations farther downgradient relative to observations in the UMCf in Zones 1 and 2 are likely related to the coarser-grained aquifer matrix in Zone 3 UMCf-cg and faulting in the area.

- Surface water sampling was performed prior to injection activities on October 16, 2020 and October 29, 2020. Five surface water sampling events have since been performed on a monthly basis since December 2020 (during injections) and continuing through April 2021 (after injections). Although limited surface water sampling will be periodically conducted downgradient of the study area, reducing perchlorate concentrations in surface water is not an objective of this pilot study. Noteworthy results related to the pilot study will be summarized in future monthly progress reports as warranted.
- **Dye Study** – As part of injection activities, rhodamine WT and fluorescein tracer dyes were injected into the alluvium and UMCf/UMCf-cg, respectively. A summary of the sampling program and results from the December 2020 and January 2021 sampling events was presented to NDEP on March 4, 2021. Available analytical results for dye samples collected during baseline activities, injection activities, and the December 2020 through March 2021 effectiveness monitoring events are provided in Table 8. There were several cases where charcoal samplers showed low detections of dye, but the water samples did not show dye, indicating that either the dye peak already passed before the water sample was collected, or the levels of dye in the water were too low to be detectable. Results from future sampling events will be evaluated to provide additional clarification of the likely scenario. Noteworthy results during this monitoring period (March 2021 sampling event) are described below:
 - Zone 2 Alluvium:
 - During injection activities, rhodamine tracer dye was measured in all four of the Zone 2 alluvium dose response wells. Three months following injection activities, rhodamine tracer dye was still being detected in either charcoal or water samples from all four dose response wells.
 - Cross-gradient monitoring wells LVWPS-A2-MW04A/B and LVWPS-A2-MW05A/B (located approximately 17 feet from either end of the Zone 2 injection well transect) had detections of rhodamine dye with the field probe in all four of these wells during injections. Three months following injections, rhodamine dye was still detected in groundwater samples collected from one monitoring well LVWPS-A2-MW05B. However, total organic carbon (TOC) concentrations (a surrogate for the carbon substrate injected) remain elevated above baseline concentrations in all four cross-gradient wells. This is expected based on the ability of the emulsified vegetable oil to adsorb to the subsurface in the vicinity of the injection well transect, whereas the tracer dye continues to move downgradient.
 - As expected, the high groundwater flow velocity in the alluvium resulted in many downgradient wells observing the presence of dye during active injections or within a few days after injections were completed. Approximately three months after injection activities were completed, rhodamine dye was detected in Zone 2 alluvium groundwater samples collected from five monitoring wells located 50 to 250 feet downgradient from the injection well transect. Additionally, rhodamine dye was detected in charcoal samplers collected from 11 monitoring wells located 50 to 250 feet downgradient from the injection well transect. Lastly, three months after injections, rhodamine dye continued to be detected in charcoal collected from LVWPS-MW209 and LVWPS-MW210A/B, which are located approximately 625 and 850 feet downgradient, respectively.

- Zone 1, 2, and 3 UMCf/UMCf-cg:
 - Zone 1 UMCf – Three months after injections were completed in Zone 1 UMCf, fluorescein tracer dye was no longer detected in groundwater samples collected 50 feet upgradient from the injection well transect at LVWPS-U1-MW06B and LVWPS-U1-MW07 indicating downgradient migration over time. Dye continued to be detected in both charcoal and groundwater samples collected from all four dose response wells and monitoring wells LVWPS-U1-MW08A/B (located 25 feet downgradient). In addition, fluorescein dye was detected in charcoal collected from monitoring well LVWPS-U1-MW02B (located approximately 33 feet downgradient) for the first time three months after the first injection event.
 - Zone 2 UMCf – Approximately three months after injections, fluorescein was detected in the groundwater sample collected from dose response well LVWPS-U2-DR02 and both cross-gradient monitoring wells LVWPS-U2-MW04 and LVWPS-U2-MW05, which are located approximately 12 feet from the injection well transect. Rhodamine and low levels of fluorescein continued to be detected in charcoal at LVWPS-U2-MW17, which is located 100 feet downgradient. The rhodamine detection is from the injections into the Zone 2 alluvium, which likely migrated into the downgradient UMCf well due to localized downward gradients present within Zone 2. Fluorescein was also detected in charcoal samples from six alluvial wells located 50 and 100 feet downgradient from the Zone 2 UMCf injection well transect, indicating upflux from the UMCf into the alluvium in the Zone 2 vicinity. These wells (LVWPS-A2-MW08C, LVWPS-A2-MW17C, LVWPS-A2-MW14A, LVWPS-A2-MW12A/B, and LVWPS-A2-MW13B) have had fluorescein detections in charcoal beginning in December 2020 to January 2021, which continued across multiple subsequent months. Two wells (LVWPS-A2-MW08C, LVWPS-A2-MW17C) have also had intermittent detections of fluorescein in water samples.
 - Zone 3 UMCf-cg – Approximately three months after injections were completed in the Zone 3 UMCf-cg, fluorescein continued to be detected in either charcoal or groundwater samples collected from all dose response wells and four of the six monitoring wells located approximately 25 feet downgradient from the Zone 3 injection well transect. In addition, fluorescein tracer dye was detected in charcoal and/or groundwater samples collected from monitoring wells LVWPS-U3-MW10A/B and LVWPS-MW12A/B, which are located approximately 100 and 150 feet downgradient, respectively.
- Access and Permitting
 - All access agreements and permits are now in place for all projected pilot study activities.
- Schedule and Progress Updates
 - The fifth monthly effectiveness monitoring event is scheduled for the week of May 3, 2021. In accordance with the Work Plan Addendum, the effectiveness monitoring program associated with Zones 1, 2, and 3 UMCf and UMCf-cg will be performed on a bimonthly basis beginning in May 2021 and continuing on a bimonthly basis until additional injections are performed in the UMCf/UMCf-cg.
 - The third injection event into all remediation zones is tentatively planned for the fourth quarter of 2021. The exact timing of the injection event will be determined based on results from the ongoing effectiveness monitoring program.

- Health and Safety
 - There were no safety incidents related to Task M19 during April 2021.
 - Safety measures continue to be implemented to minimize potential exposure to COVID-19, including the use of face coverings, gloves, and hand sanitizer, as well as protocols for monitoring temperatures, minimizing the number of people on site at one time, and evaluating tasks to increase physical distance between personnel.

Notes

amsl - above mean sea level

bgs - below ground surface

bTOC - below top of casing

PVC - polyvinyl chloride

UMCf - Upper Muddy Creek formation

UMCf-cg - Upper Muddy Creek formation - coarse grained facies

UMCf/Horse Springs- Alternating layers of UMCf, semi-consolidated UMCf, and reworked Horse Springs formation.

UMCf (Semi-Cons) - Semi-consolidated Upper Muddy Creek formation

--- Not Applicable

1. Depth to water measurements collected in October 2020.

2. Well names including IW indicate an injection well. Well names including DR indicate a dose response well. Well names including MW indicate a monitoring well. Well names including EW indicate an extraction well.

Daily Summary						0	2,014.5	
Injection Event Summary						57,815	200,865	

Notes:

gpm - gallons per minute

min - minutes

gal - gallons

psi - pounds per square inch

¹Injection duration indicates the total minutes of active injection per day, accounting for any downtime in injections that may have occurred throughout the day. Therefore, injection duration may be less than the difference in daily injection start and stop times indicated.

²Sustained pressure reported represents the highest pressure recorded during the injection interval indicated.

SD - standard deviation

1. Injectate solution includes emulsified vegetable oil (EOS_{PRO}), glycerin, and sodium sulfite mixed into extracted groundwater. A 1:4 injectate stock solution standard was prepared for each mixture of deliveries of EOS_{PRO} used for batch mixing.

4A	4/17/2021	10:56	5725.5	0.991	76	0.993	16.8%	YES	

1. The acceptable range of specific gravity measurements was determined to be 0.991 to 0.999 for EOS_{PRO} Deliveries 1 and 3, and 0.992 to 1.000 for batches mixed from EOS_{PRO} Delivery 2. This was determined by taking +/- 10% of the difference between the pure EOS_{PRO} and the pure extracted groundwater (equivalent to 0.004) and then adding and subtracting that value with the specific gravity of the 1:4 standard (shown in Table 5).

2. Tank level approximated based on sample collection time and average injection rates.

Notes:

Not tested.

The result is an estimated quantity, but the result may be biased low.

The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

The result is an estimated quantity, but the result may be biased high.

The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.

The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.

Extraction system with generator, bag filters, and extraction system pump.

Right: Four bag filters are used to filter sediment from the extracted groundwater prior to the groundwater being pumped to the frac tanks/injection system in the laydown area.

Left: Extraction manifold with flow meter for each extraction well.

 TETRA TECH www.tetratech.com	NEVADA ENVIRONMENTAL RESPONSE TRUST HENDERSON, NEVADA Las Vegas Wash Bioremediation Pilot Study, Injection Event 2	Project No.:117-7502019-M19-01

Extraction line to laydown area with three (red) frac tanks. Zone 2 injection well transect with injection lines to each dual-nested injection well screened in the alluvium.

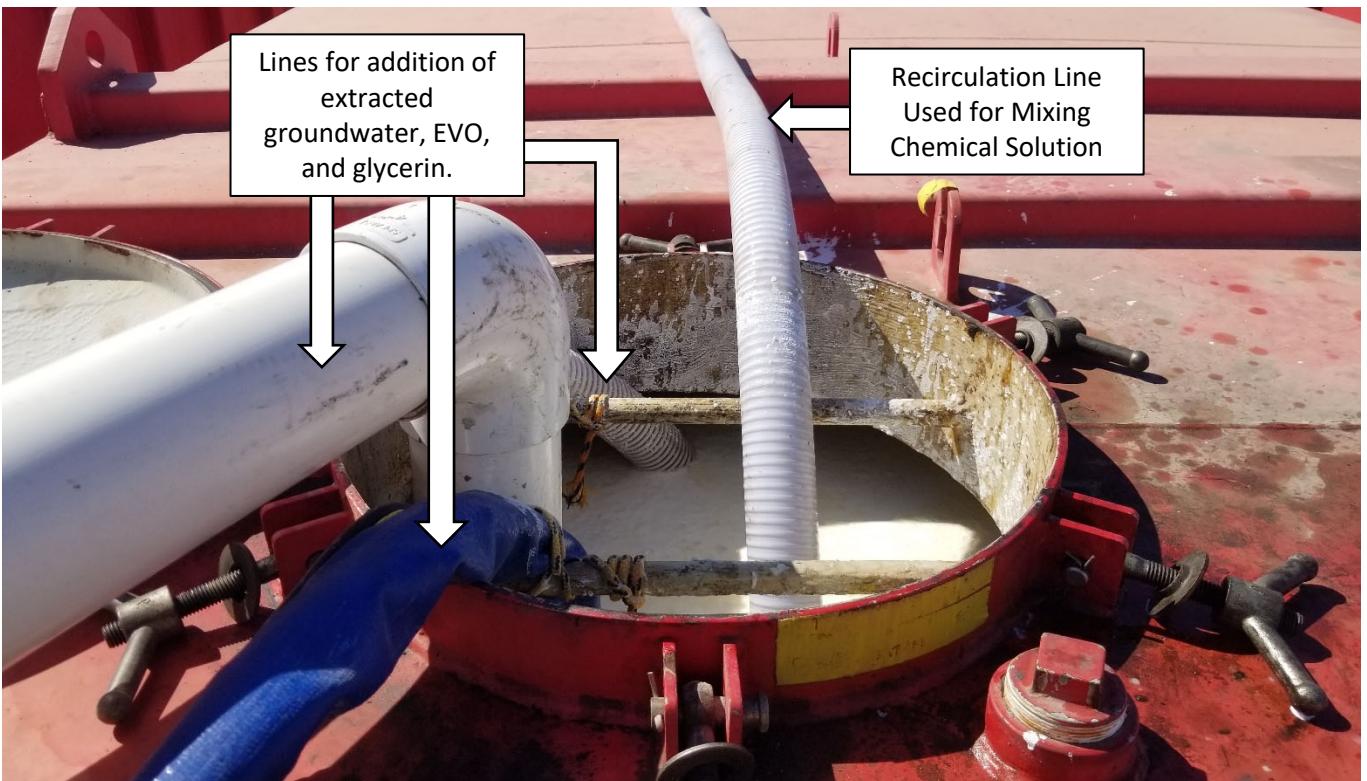

Injection manifold with flow meters and pressure gauges for each injection well.

 TETRA TECH www.tetratech.com 150 South 4 th Street Henderson, Nevada 89015 PHONE: (702) 854-2293	NEVADA ENVIRONMENTAL RESPONSE TRUST HENDERSON, NEVADA Las Vegas Wash Bioremediation Pilot Study, Injection Event 2	Project No.:117-7502019-M19-01 Date.: 5/12/2021 Designed By: JD Page No. 2 of 4

Injection laydown area with chemical amendments, mixing frac tanks and injection system (generator and pumps).

Frac tank used for mixing with 1 part EVO to 4 parts groundwater chemical injectate solution. Submersible pumps recirculate solution to mix solution components.

 TETRA TECH www.tetratech.com 150 South 4 th Street Henderson, Nevada 89015 PHONE: (702) 854-2293	NEVADA ENVIRONMENTAL RESPONSE TRUST HENDERSON, NEVADA Las Vegas Wash Bioremediation Pilot Study, Injection Event 2	Project No.:117-7502019-M19-01 Date.: 5/12/2021 Designed By: JD Page No. 3 of 4

Collecting a sample of the injectate solution for specific gravity analysis to ensure the solution is mixed thoroughly prior to injection.

Measuring specific gravity and temperature of injectate solution sample.
