Subject: Las Vegas Wash ZVI-Enhanced Bioremediation Treatability Study Monthly Progress Report

At the direction of the Nevada Environmental Response Trust (NERT or Trust), Tetra Tech, Inc. (Tetra Tech) has prepared this memorandum to summarize Tetra Tech's progress during January 2024 toward successfully implementing the Las Vegas Wash Zero-Valent Iron (ZVI)-Enhanced Bioremediation Treatability Study.

Task Progress Update: January 2024

Task M18 – Las Vegas Wash ZVI-Enhanced Bioremediation Treatability Study

- Current Status –

The Las Vegas Wash ZVI-Enhanced Bioremediation Treatability Study is being conducted to evaluate the effectiveness of ZVI-enhanced bioremediation of perchlorate-contaminated groundwater that has migrated downgradient of the NERT site toward the Las Vegas Wash. The general treatability study layout, including locations of the continuous and discontinuous ZVI walls and associated injection well and monitoring well network, is presented on Figures 1, 2a, and 2b. Well construction details are provided in Table 1. The construction phase of the treatability study was completed on April 24, 2023 and the performance monitoring phase is ongoing.

- Performance Monitoring – The performance monitoring program included a pre-construction, baseline groundwater sampling event completed in October 2022 prior to installation of the continuous and discontinuous ZVI walls and performance monitoring network. Following construction of the ZVI walls, installation of the performance monitoring network, and injection of biological inoculum and nutrient solution (completed in February through April 2023), the performance monitoring program began in May 2023 and is ongoing. The performance monitoring program is being implemented in accordance with the NDEP-approved Work Plan Addendum, which includes monthly synoptic gauging events to evaluate hydrologic changes over time and groundwater sampling events approximately one month after completion of the construction phase and quarterly thereafter for a total of 16 months. The latest monthly synoptic gauging event was conducted from January 17 to January 18, 2024. The Month 1 groundwater performance monitoring event was completed in May 2023, followed by quarterly performance

monitoring events in August 2023 and November/December 2023. Results from the May and August 2023 performance monitoring events were presented in previous monthly progress reports, while results of the November/December 2023 sampling event (performed approximately eight months after completion of the construction phase) are presented herein. Available draft groundwater analytical results from the baseline sampling event, and the subsequent performance monitoring events are presented in Table 2.

It should be noted that in accordance with Section 7.6.4 of the NDEP-approved Work Plan Addendum, the majority of the performance monitoring network had to be installed after emplacement of the ZVI to prevent damage to well infrastructure. As a result, pre-construction baseline concentrations are not available on a well-by-well basis for all performance monitoring wells. Therefore, performance is being evaluated by comparing constituent concentrations from individual monitoring wells to the average October 2022 baseline concentration within each treatability study test area. For example, samples collected from each performance monitoring well installed in Test Area 1a are compared to the average concentration of samples collected from existing pre-construction wells within Test Area 1a during the October 2022 baseline sampling event.

- Test Area 1a – Test Area 1a includes the northernmost 100 feet of the 3-foot wide, 200-foot-long continuous ZVI wall installed in the alluvium via one pass trenching, which was backfilled with 10 percent ZVI by weight. Notable groundwater results from the November/December 2023 sampling event are provided below.
 - Groundwater samples collected from upgradient monitoring wells screened in the alluvium in November/December 2023 indicated an average perchlorate concentration of 5,243 micrograms per liter ($\mu\text{g}/\text{L}$), which is greater than the average October 2022 baseline perchlorate concentration for Test Area 1a of 4,607 $\mu\text{g}/\text{L}$. Results of the groundwater samples collected from monitoring wells located directly within the continuous ZVI wall indicated perchlorate concentrations ranging from 1,700 $\mu\text{g}/\text{L}$ to 3,060 $\mu\text{g}/\text{L}$, which represents reductions ranging from 34 percent to 63 percent compared to the average baseline concentration of 4,607 $\mu\text{g}/\text{L}$. The lowest November/December 2023 perchlorate concentration within the alluvium at Test Area 1a was measured in the groundwater samples collected from ZTS-MW164, where the perchlorate concentration reduced from 3,740 $\mu\text{g}/\text{L}$ in May 2023 to 1,700 $\mu\text{g}/\text{L}$ in November/December 2023.
 - Groundwater samples collected from three of the 11 downgradient monitoring wells screened in the alluvium during the November/December 2023 sampling event indicated slight reductions in perchlorate concentrations of up to 26 percent compared to the average baseline perchlorate concentration. These results were generally expected as the bench-scale study indicated that the removal of nitrate and chlorate can be rapid due to abiotic processes occurring primarily on the ZVI surface, while the reduction of perchlorate is slower and performed predominantly by autotrophic perchlorate-reducing bacteria using hydrogen generated at the ZVI surface. The injection of a biological inoculum completed in April 2023 was performed to reduce the lag time associated with acclimation and growth of the microbial community. The perchlorate concentrations within Test Area 1a will continue to be monitored.
 - Concentration reductions of chlorate and nitrate were more pronounced than perchlorate reductions, which is consistent with the conclusions of the bench-scale study (as previously explained). Chlorate concentrations in samples

collected within the continuous ZVI wall indicated reductions ranging from 23 percent to 99 percent compared to baseline concentrations. Nitrate concentrations in groundwater collected from two of the three monitoring wells located within the continuous ZVI wall indicated reductions of 10 percent to 86 percent compared to baseline concentrations. Groundwater samples collected from five out of 11 monitoring wells located 5 to 150 feet downgradient of the continuous ZVI wall indicated chlorate reductions ranging from 36 percent to 73 percent compared to baseline concentrations. Groundwater samples collected from six of the 11 monitoring wells located 5 to 150 feet downgradient of the continuous ZVI wall indicated nitrate concentration reductions ranging from 5 percent to 63 percent.

- Lastly, dissolved hydrogen is another key indicator parameter that is being monitored during the treatability study because it is produced from the slow corrosion of ZVI and can be used as an electron donor by perchlorate reducing bacteria for degradation of perchlorate. The baseline dissolved hydrogen concentrations within the Test 1a area averaged 68 nanomolar (nM). Groundwater samples collected from monitoring well ZTS-MW164 (located directly within the continuous ZVI wall) indicated a significantly elevated dissolved hydrogen concentration of 2,100 nM during the Month 1 May 2023 sampling event, which increased to 2,400 nM during the August 2023 sampling. The dissolved hydrogen concentration reduced to 116 nM in November/December 2023, which continues to be elevated compared to the average baseline concentration of 68 nM but is significantly reduced from previous events. Although dissolved hydrogen concentrations above baseline concentrations were not observed in samples collected from monitoring wells ZTS-MW150 and ZTS-MW154, which are also located within the continuous ZVI wall, perchlorate concentrations in groundwater at these locations continued to indicate decreasing perchlorate concentration trends with reductions up to 62 percent compared to the average baseline concentration. Elevated dissolved hydrogen concentrations were not observed in any other monitoring wells located downgradient of the continuous wall within the Test 1a area. Therefore, dissolved hydrogen is likely being produced and consumed within this portion of the continuous ZVI wall.
- Test Area 1b –Test Area 1b includes the southernmost 100 feet of the 3-foot wide, 200-foot-long continuous ZVI wall installed in the alluvium via one pass trenching, which was backfilled with 30 percent ZVI by weight. Notable groundwater results from the November/December 2023 sampling event are provided below.
 - Groundwater samples collected from upgradient monitoring wells screened in the alluvium in November/December 2023 indicated an average perchlorate concentration of 5,580 µg/L, which is slightly lower than the average October 2022 baseline perchlorate concentration of 7,234 µg/L. Groundwater samples collected from two of the three monitoring wells located within the continuous ZVI wall indicated perchlorate concentrations ranging from 5,370 µg/L to 5,450 µg/L. Although these concentrations represent reductions of approximately 25 percent compared to the average baseline concentration of 7,234 µg/L in October 2022, the November/December 2023 concentrations in the groundwater samples collected from within the continuous ZVI wall are similar to current upgradient perchlorate concentrations. The perchlorate concentration in groundwater collected from ZTS-MW166 (also located within the continuous ZVI wall)

increased to above the baseline concentration to 9,260 µg/L in November/December 2023. Samples collected from nine of the 11 downgradient monitoring wells screened in the alluvium during the November/December 2023 sampling event indicated reductions in perchlorate concentrations ranging from 17 percent to 47 percent compared to the average baseline perchlorate concentration.

- Reductions in chlorate and nitrate concentrations at monitoring wells within Test Area 1b were significantly more pronounced than those observed for perchlorate. Chlorate concentrations in groundwater samples collected from all 14 monitoring wells within Test Area 1b (wells located within the continuous ZVI wall and 5 feet to 150 feet downgradient) reduced by an average of 92 percent compared to the average baseline chlorate concentration. Furthermore, chlorate concentrations reduced to less than the sample detection limit in groundwater samples collected from 11 monitoring wells, including one monitoring well located 100 feet downgradient of the continuous ZVI wall. Similarly, groundwater samples collected from 10 of the 14 monitoring wells located within or downgradient of the continuous ZVI wall indicated nitrate concentration reductions ranging from 28 percent to 97 percent compared to baseline. Nitrate concentrations reduced to less than 5 mg/L in groundwater samples collected from seven of these monitoring wells, which is significantly lower than the average baseline concentration of 19 mg/L.
- Baseline dissolved hydrogen concentrations averaged 21 nM in the alluvium within the Test 1b area. Groundwater samples collected during November/December 2023 from monitoring wells ZTS-MW166 and ZTS-MW178 (both located within the continuous ZVI wall) continued to indicate significantly elevated dissolved hydrogen concentrations of 6,130 nM and 4,140 nM, respectively. In addition, dissolved hydrogen concentrations in groundwater samples collected from monitoring well ZTS-MW171 (also located within the continuous ZVI wall) increased from 12.5 nM in August 2023 to 41 nM in November/December 2023. Elevated dissolved hydrogen concentrations were not observed in any other monitoring wells located downgradient of the continuous wall within the Test 1b area, which suggests hydrogen consumption is occurring at the continuous wall as expected.
- Test Area 2a –Test Area 2a is a 24-foot long, discontinuous ZVI wall that targets the alluvium and is comprised of seventeen 12-inch diameter ZVI-filled borings installed along two staggered rows, with each boring backfilled with 50% ZVI by weight. Notable groundwater results from the November/December 2023 sampling event are provided below.
 - The average October 2022 baseline perchlorate concentration in groundwater samples collected from monitoring wells screened in the alluvium within Test Area 2a was 6,798 µg/L. Perchlorate concentration reductions ranging from 12 percent to 34 percent were observed in groundwater samples collected from the three monitoring wells located within and immediately downgradient of the discontinuous ZVI wall, with concentrations ranging from 4,520 µg/L to 5,980 µg/L.
 - Chlorate and nitrate concentration reductions of 27 percent and 56 percent, respectively, were observed in the groundwater sample collected from monitoring well ZTS-MW191, which is located immediately downgradient of the

discontinuous ZVI wall. Chlorate and nitrate concentrations measured in groundwater samples collected from the remaining monitoring wells were similar to or higher than the baseline average concentration of 88,280 µg/L and 19 mg/L, respectively.

- The baseline dissolved hydrogen concentrations in groundwater samples collected from monitoring wells located within Test Area 2a during the October 2022 baseline sampling event averaged 15 nM. The most notable increase in dissolved hydrogen concentration within Test Area 2a was the groundwater sample collected from monitoring well ZTS-MW191 (located immediately downgradient of the discontinuous ZVI wall), which indicated a dissolved hydrogen concentration of 2,400 nM.
- Test Area 2b – Test Area 2b is a 12-foot long, discontinuous ZVI wall that targets the Upper Muddy Creek formation (UMCf) and is comprised of nine 12-inch diameter ZVI-filled borings installed along two staggered rows, with each boring backfilled with 50% ZVI by weight. Due to the large, saturated thickness of the targeted UMCf treatment interval, paired performance monitoring wells were installed at two depth intervals from approximately 25-45 feet below ground surface (bgs) and from approximately 50 to 65 feet bgs. Notable groundwater results from the November/December 2023 sampling event are provided below.
 - The average baseline perchlorate concentration in groundwater samples collected from monitoring wells screened in the UMCf was 3,156 µg/L. Perchlorate concentration reductions were observed in groundwater samples collected from six of the eight monitoring wells located two to seven feet downgradient of the discontinuous ZVI wall. Perchlorate concentrations in groundwater samples collected from these six monitoring wells ranged from 31 µg/L to 2,410 µg/L during the November/December 2023 sampling event, which represent reductions ranging from 24 percent to 99 percent compared to the average baseline concentration of 3,156 µg/L. In general, monitoring wells screened in the shallow UMCf indicated higher reductions in perchlorate. For example, perchlorate concentrations of 31 µg/L and 43 µg/L, which represent reductions of 99 percent, were measured in groundwater samples collected from shallow UMCf monitoring wells ZTS-MW136 and ZTS-MW198, respectively. Although groundwater samples collected from two downgradient monitoring wells screened in the deep UMCf immediately adjacent to the discontinuous ZVI wall indicated perchlorate concentration reductions ranging from 24 percent to 63 percent, groundwater samples collected from monitoring wells located 5 feet to 15 feet downgradient and screened in the deep UMCf measured greater than the average baseline concentration.
 - Chlorate concentration reductions of 99 percent were observed in groundwater samples collected from four of the eight monitoring wells located two to seven feet downgradient of the discontinuous ZVI wall. Nitrate concentration reductions ranging from 75 percent to 93 percent were observed in samples collected from three out of eight monitoring wells located two to seven feet downgradient of the discontinuous ZVI wall.
 - Dissolved hydrogen concentrations averaged 79 nM during the October 2022 baseline event. The groundwater sample collected from downgradient monitoring well ZTS-MW200, which is located two feet downgradient of the discontinuous

ZVI wall in the deep UMCf, continued to exhibit elevated dissolved hydrogen concentrations, with a concentration of 3,340 nM in November/December 2023.

- Test Area 2c – Test Area 2c is a 24-foot long, discontinuous ZVI wall that targets the alluvium and is comprised of twenty-five 12-inch diameter ZVI-filled borings installed along three staggered rows, with each boring backfilled with 50% ZVI by weight. Notable groundwater results from the November/December 2023 sampling event are provided below.
 - The average baseline perchlorate concentration in groundwater samples collected from monitoring wells screened in the alluvium within Test Area 2c was 6,993 µg/L. Slight perchlorate concentration reductions ranging from 9 percent to 25 percent were observed in groundwater samples collected from all nine monitoring wells located within or downgradient of the discontinuous ZVI wall, with concentrations ranging from 5,260 µg/L to 6,330 µg/L during the November/December 2023 sampling event.
 - Slight chlorate reductions were observed in groundwater samples collected in November/December 2023 from six of the nine monitoring wells located within or downgradient of the discontinuous ZVI wall. The most significant chlorate concentration reduction of 28 percent was observed in the groundwater sample collected from monitoring well ZTS-MW143, which is located 5 feet downgradient of the Test Area 2c discontinuous ZVI wall. A slight reduction in nitrate concentration of 13 percent compared to the average baseline concentration of 18 mg/L was observed in the groundwater sample collected from monitoring well ZTS-MW182, which is located within the Test Area 2c discontinuous ZVI wall.
 - Dissolved hydrogen concentrations averaged 5.5 nM during the October 2022 baseline event. Notably elevated dissolved hydrogen concentrations were detected in groundwater samples collected from four monitoring wells screened in the alluvium in Test Area 2c (ZTS-MW141, ZTS-MW142, ZTS-MW182, and ZTS-MW189) with concentrations ranging from 140 to 900 nM during the May 2023 sampling event. However, elevated dissolved hydrogen concentrations were not observed in groundwater samples collected from Test Area 2c monitoring wells during the August and November/December 2023 sampling events.
- Monthly Synoptic Monitoring – Monthly synoptic monitoring is being performed to evaluate any changes in horizontal and vertical gradients, assess for potential groundwater mounding upgradient of the ZVI reactive zone, assess hydraulic effects of seasonal precipitation, and evaluate potential non-uniform flow. Results of the January 2023 monthly synoptic monitoring event do not indicate any significant changes to groundwater elevations in monitoring wells located upgradient, within, and downgradient of ZVI reactive zones.
- Schedule and Progress Updates
 - Groundwater levels will continue to be measured on a monthly basis for the duration of the treatability study. The next monthly synoptic event is scheduled for February 19, 2024.
 - Groundwater samples will continue to be collected on a quarterly basis to generate time-series data to evaluate the treatment effectiveness of the ZVI installations with respect to the design performance criteria. The next quarterly groundwater sampling event is planned for February 19 through February 23, 2024.
- Health and Safety

- There were no health and safety incidents related to Task M18 during January 2024.

Notes

amsl - above mean sea level

bgs - below ground surface

bTOC - below top of casing

NM - not measured

PVC - polyvinyl chloride

UMCf - Upper Muddy Creek formation

Semi-Cons - Semi-Consolidated

1. Depth to water collected on May 16-17, 2023.

Notes:

1. Distances from the discontinuous or continuous walls are shown as negative values for upgradient monitoring wells, as zero for monitoring wells screened within the walls, and as positive values for monitoring wells located downgradient of the walls.

bgs - below ground surface

J- The result is an estimated quantity, but the result may be biased low.

J The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

J+ The result is an estimated quantity, but the result may be biased high.

R The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.

UJ The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

< The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.

mg/L - milligram per liter

mS/cm - millSiemens per centimeter

mV - millivolts

nmol - nanomol

SU - standard units

N - normal field sample

µg/L - micrograms per liter

UMCf - Upper Muddy Creek formation

FD - field duplicate

FS - field split

Notes:

1. Distances from the discontinuous or continuous walls are shown as negative values for upgradient monitoring wells, as zero for monitoring wells screen

bgs - below ground surface

J- The result is an estimated quantity, but the result may be biased low.

J The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

J+ The result is an estimated quantity, but the result may be biased high.

R The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present

UJ The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

< The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.

mg/L - milligram per liter

mS/cm - millSiemens per centimeter

mV - millivolts

nmol - nanomol

SU - standard units

N - normal field sample

µg/L - micrograms per liter

UMCf - Upper Muddy Creek formation

FD - field duplicate

FS - field split

Notes:

1. Distances from the discontinuous or continuous walls are shown as negative values for upgradient monitoring wells, as zero for monitoring wells screen

bgs - below ground surface

J- The result is an estimated quantity, but the result may be biased low.

J The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

J+ The result is an estimated quantity, but the result may be biased high.

R The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present

UJ The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

< The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.

mg/L - milligram per liter

mS/cm - millSiemens per centimeter

mV - millivolts

nmol - nanomol

SU - standard units

N - normal field sample

µg/L - micrograms per liter

UMCf - Upper Muddy Creek formation

FD - field duplicate

FS - field split

Notes:

1. Distances from the discontinuous or continuous walls are shown as negative values for upgradient monitoring wells, as zero for monitoring wells scre

bgs - below ground surface

J- The result is an estimated quantity, but the result may be biased low.

J The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

J+ The result is an estimated quantity, but the result may be biased high.

R The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present

UJ The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

< The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.

mg/L - milligram per liter

mS/cm - millSiemens per centimeter

mV - millivolts

nmol - nanomol

SU - standard units

N - normal field sample

µg/L - micrograms per liter

UMCf - Upper Muddy Creek formation

FD - field duplicate

FS - field split

Notes:

1. Distances from the discontinuous or continuous walls are shown as negative values for upgradient monitoring wells, as zero for monitoring wells scre

bgs - below ground surface

J- The result is an estimated quantity, but the result may be biased low.

J The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

J+ The result is an estimated quantity, but the result may be biased high.

R The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present

UJ The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

< The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.

mg/L - milligram per liter

mS/cm - millSiemens per centimeter

mV - millivolts

nmol - nanomol

SU - standard units

N - normal field sample

µg/L - micrograms per liter

UMCf - Upper Muddy Creek formation

FD - field duplicate

FS - field split
